

MAXIM

Ultra Low Offset Voltage Operational Amplifier

MAX400

General Description

The MAX400 guaranteed maximum $10\mu V$ offset error is the lowest input offset voltage of any commercially available (nonchopper) monolithic amplifier. The MAX400 represents a 2.5 times improvement over the highest grade OP07 (the OP07A), and a 5 times improvement over the best commercial temperature range device (OP07E). The offset voltage drift is guaranteed to be a maximum of $0.3\mu V/\text{°C}$ which is also an improvement over the OP07 family.

For the ultimate in DC performance ($5\mu V$ maximum offset voltage and $0.05\mu V/\text{°C}$ maximum offset voltage drift) the MAX420 and MAX430 series of $\pm 15V$ monolithic chopper stabilized amplifiers should be consulted.

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
