

High-Output-Drive, Precision, Low-Power, Single-Supply, Rail-to-Rail I/O Op Amps with Shutdown

MAX4165-MAX4169

General Description

The MAX4165-MAX4169 family of operational amplifiers combines excellent DC accuracy with high output current drive, single-supply operation, and Rail-to-Rail® inputs and outputs. These devices operate from a single +2.7V to +6.5V supply, or from dual $\pm 1.35V$ to $\pm 3.25V$ supplies. They typically draw 1.2mA supply current, and are guaranteed to deliver 80mA output current.

The MAX4166/MAX4168 have a shutdown mode that reduces supply current to 38 μA per amplifier and places the outputs into a high-impedance state. The MAX4165-MAX4169's precision performance combined with high output current, wide input/output dynamic range, single-supply operation, and low power consumption makes them ideal for portable audio applications and other low-voltage, battery-powered systems. The MAX4165 is available in the space-saving 5-pin SOT23 package.

Selector Guide

PART	AMPS PER PACKAGE	SHUTDOWN MODE
MAX4165	Single	—
MAX4166	Single	Yes
MAX4167	Dual	—
MAX4168	Dual	Yes
MAX4169	Quad	—

Applications

Portable/Battery-Powered Audio Applications
 Portable Head-Phone Speaker Drivers
 Laptop/Notebook Computers
 Sound Ports/Cards
 Set-Top Boxes
 Cell Phones
 Hands-Free Car Phones (kits)
 Signal Conditioning
 Digital-to-Analog Converter Buffers
 Transformer/Line Drivers
 Motor Drivers

Typical Operating Circuit appears at end of data sheet.

Rail-to-Rail is a registered trademark of Nippon Motorola Ltd.

Features

- ◆ 80mA (min) Output Drive Capability
- ◆ Rail-to-Rail Input Common-Mode Voltage Range
- ◆ Rail-to-Rail Output Voltage Swing
- ◆ 1.2mA Supply Current per Amplifier
- ◆ +2.7V to +6.5V Single-Supply Operation
- ◆ 5MHz Gain-Bandwidth Product
- ◆ 250 μV Offset Voltage
- ◆ 120dB Voltage Gain ($R_L = 100k\Omega$)
- ◆ 88dB Power-Supply Rejection Ratio
- ◆ No Phase Reversal for Overdriven Inputs
- ◆ Unity-Gain Stable for Capacitive Loads to 250pF
- ◆ Low-Power Shutdown Mode:
 Reduces Supply Current to 38 μA
 Places Outputs in High-Impedance State
- ◆ Available in 5-Pin SOT23 Package (MAX4165)

Note 1: Continuous power dissipation should also be observed.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

High-Output-Drive, Precision, Low-Power, Single-Supply, Rail-to-Rail I/O Op Amps with Shutdown

Applications Information

Package Power Dissipation

Warning: Due to the high output current drive, this op amp can exceed the absolute maximum power-dissipation rating. As a general rule, as long as the peak current is less than or equal to 80mA, the maximum package power dissipation will not be exceeded for any of the package types offered. There are some exceptions to this rule, however. The absolute maximum power-dissipation rating of each package should always be verified using the following equations. The following equation gives an approximation of the package power dissipation:

$$P_{IC(DISS)} \cong V_{RMS} I_{RMS} \cos \theta$$

where: V_{RMS} = the RMS voltage from V_{CC} to V_{OUT} when sourcing current

= the RMS voltage from V_{OUT} to V_{EE} when sinking current

I_{RMS} = the RMS current flowing out of or into the op amp and the load

θ = the phase difference between the voltage and the current. For resistive loads, $\cos \theta = 1$.

For example, the circuit in Figure 1 has a package power dissipation of 157mW.

$$\begin{aligned} V_{RMS} &\cong (V_{CC} - V_{DC}) - \frac{V_{PEAK}}{\sqrt{2}} \\ &= 6.5V - 3.25V - \frac{1.5V}{\sqrt{2}} = 2.189V_{RMS} \end{aligned}$$

$$\begin{aligned} I_{RMS} &\cong I_{DC} + \frac{I_{PEAK}}{\sqrt{2}} = \frac{3.25V}{60\Omega} + \frac{1.5V/60\Omega}{\sqrt{2}} \\ &= 71.84mA_{RMS} \end{aligned}$$

Therefore, $P_{IC(DISS)} = V_{RMS} I_{RMS} \cos \theta = 157mW$

Adding a coupling capacitor improves the package power dissipation because there is no DC current to the load, as shown in Figure 2.

$$\begin{aligned} V_{RMS} &\cong (V_{CC} - V_{DC}) - \frac{V_{PEAK}}{\sqrt{2}} \\ &= 6.5V - 3.25V - \frac{1.5V}{\sqrt{2}} = 2.189V_{RMS} \end{aligned}$$

$$\begin{aligned} I_{RMS} &\cong I_{DC} + \frac{I_{PEAK}}{\sqrt{2}} = 0A + \frac{1.5V/60\Omega}{\sqrt{2}} \\ &= 17.67mA_{RMS} \end{aligned}$$

Figure 1. A Circuit Example where the MAX4165/MAX4166 is Being Used in Single-Supply Operation

Figure 2. A Circuit Example where Adding a Coupling Capacitor Greatly Reduces the Power Dissipation of Its Package

Therefore, $P_{IC(DISS)} = V_{RMS} I_{RMS} \cos \theta = 38.6mW$

The absolute maximum power-dissipation rating of this package would be exceeded if the configuration in Figure 1 were used with all four of the MAX4169ESD's amplifiers at a high ambient temperature of +75°C (157mW x 4 amplifiers = 628mW + a derating of 8.33mW/°C x 5°C = 669mW). Note that 669mW just exceeds the absolute maximum power dissipation of 667mW for the 14-pin SO package (see the *Absolute Maximum Ratings* section).

High-Output-Drive, Precision, Low-Power, Single-Supply, Rail-to-Rail I/O Op Amps with Shutdown

Figure 3. Dual MAX4167/MAX4168 Bridge Amplifier for 200mW at 3V

Single-Supply Speaker Driver

The MAX4165/MAX4166 can be used as a single-supply speaker driver, as shown in the *Typical Operating Circuit*. Capacitor C1 is used for blocking DC (a 0.1µF ceramic capacitor can be used). When choosing resistors R3 and R4, take into consideration the input bias current as well as how much supply current can be tolerated. Choose resistors R1 and R2 according to the amount of gain and current desired. Capacitor C3 ensures unity gain for DC. A 10µF electrolytic capacitor is suitable for most applications. The coupling capacitor C2 sets a low-frequency pole and is fairly large in value. For a 32Ω load, a 100µF coupling capacitor gives a low-frequency pole at 50Hz. The low-frequency pole can be set according to the following equation:

$$f = 1 / 2\pi (R_L C_2)$$

Bridge Amplifier

The circuit shown in Figure 3 uses a dual MAX4167/MAX4168 to implement a 3V, 200mW amplifier suitable for use in size-constrained applications. This configuration eliminates the need for the large coupling capacitor required by the single op-amp speaker driver when single-supply operation is a must. Voltage gain is set to +10V/V; however, it can be changed by adjusting the 900kΩ resistor value. DC voltage at the speaker is limited to 10mV. The 47Ω and 0.1µF capacitors across the speaker maintain a low impedance at the load as frequency increases.

Figure 4. Reducing Offset Error Due to Bias Current (Noninverting)

Figure 5. Reducing Offset Error Due to Bias Current (Inverting)

Rail-to-Rail Input Stage

Devices in the MAX4165-MAX4169 family of high-output-current amplifiers have rail-to-rail input and output stages designed for low-voltage, single-supply operation. The input stage consists of separate NPN and PNP differential stages that combine to provide an input common-mode range that extends 0.25V beyond the supply rails. The PNP stage is active for input voltages close to the negative rail, and the NPN stage is active for input voltages near the positive rail. The switchover transition region, which occurs near $V_{CC} / 2$, has been extended to minimize the slight degradation in common-mode rejection ratio caused by mismatch of the input pairs.

High-Output-Drive, Precision, Low-Power, Single-Supply, Rail-to-Rail I/O Op Amps with Shutdown

Figure 6. Input Protection Circuit

Since the input stage switches between the NPN and PNP pairs, the input bias current changes polarity as the input voltage passes through the transition region. Match the effective impedance seen by each input to reduce the offset error caused by input bias currents flowing through external source impedances (Figures 4 and 5).

High source impedances, together with input capacitance, can create a parasitic pole that produces an underdamped signal response. Reducing the input impedance or placing a small (2pF to 10pF) capacitor across the feedback resistor improves response.

The MAX4165–MAX4169’s inputs are protected from large differential input voltages by 1kΩ series resistors and back-to-back triple diodes across the inputs (Figure 6).

For differential voltages less than 1.8V, input resistance is typically 500kΩ. For differential input voltages greater than 1.8V, input resistance is approximately 2kΩ. The input bias current is given by the following equation:

$$I_{BIAS} = (V_{DIFF} - 1.8V) / 2k\Omega$$

Rail-to-Rail Output Stage

The minimum output is within millivolts of ground for single-supply operation, where the load is referenced to ground (V_{EE}). Figure 7 shows the input voltage range and the output voltage swing of a MAX4165 connected as a voltage follower. The maximum output voltage swing is load dependent; however, it is guaranteed to be within 430mV of the positive rail (V_{CC} = 5V) even with maximum load (25Ω to ground).

Figure 7. Rail-to-Rail Input/Output Range

Driving Capacitive Loads

The MAX4165–MAX4169 have a high tolerance for capacitive loads. They are stable with capacitive loads up to 250pF. Figure 8 is a graph of the stable operating region for various capacitive loads vs. resistive loads. Figures 9 and 10 show the transient response with excessive capacitive loads (1500pF), with and without the addition of an isolation resistor in series with the output. Figure 11 shows a typical noninverting capacitive-load-driving circuit in the unity-gain configuration. The resistor improves the circuit’s phase margin by isolating the load capacitor from the op amp’s output.

Figure 8. Capacitive Load Stability

Figure 9. Small-Signal Transient Response with Excessive Capacitive Load

Figure 10. Small-Signal Transient Response with Excessive Capacitive Load with Isolation Resistor

Figure 11. Capacitive-Load-Driving Circuit

Power-Up and Shutdown Modes

The MAX4166/MAX4168 have a shutdown option. When the shutdown pin ($\overline{\text{SHDN}}$) is pulled low, supply current drops to $58\mu\text{A}$ per amplifier ($V_{\text{CC}} = +5\text{V}$), the amplifiers are disabled, and their outputs are placed in a high-impedance state. Pulling $\overline{\text{SHDN}}$ high or leaving it floating enables the amplifier. In the dual MAX4168, the two amplifiers shut down independently. Figures 12 and 13 show the MAX4166's output voltage and supply-current responses to a shutdown pulse. The MAX4166-MAX4169 typically settle within $5\mu\text{s}$ after power-up (Figure 14).

Power Supplies and Layout

The MAX4165-MAX4169 can operate from a single $+2.7\text{V}$ to $+6.5\text{V}$ supply, or from dual $\pm 1.35\text{V}$ to $\pm 3.25\text{V}$ supplies. For single-supply operation, bypass the power supply with a $0.1\mu\text{F}$ ceramic capacitor in parallel with at least $1\mu\text{F}$. For dual-supply operation, bypass each supply to ground. Good layout improves performance by decreasing the amount of stray capacitance at the op amps' inputs and outputs. Decrease stray capacitance by placing external components close to the op amps' pins, minimizing trace and lead lengths.

High-Output-Drive, Precision, Low-Power, Single-Supply, Rail-to-Rail I/O Op Amps with Shutdown
