MAXIM

Fault-Protected, High-Voltage, Single 4-to-1/Dual 2-to-1 Multiplexers

General Description

The MAX4534 (single 4-to-1) and MAX4535 (dual 2-to-1) fault-protected multiplexers operate with ±4.5V to ±20V dual supplies or a +9V to +36V single supply. These multiplexers feature fault-protected inputs, Rail-to-Rail® signal-handling capability, and overvoltage clamping at 150mV beyond the rails. Both parts feature ±40V overvoltage protection with supplies off and ±25V protection with supplies on. On-resistance is 400Ω max and is matched between channels to 10Ω max. All digital inputs have TTL logic thresholds, ensuring TTL/CMOS-logic compatibility when using a single +12V or dual ±15V supplies.

Applications

Data-Acquisition Systems

Industrial and Process Control

Avionics

Signal Routing

Redundant/Backup Systems

Features

- ♦ **±40V Fault Protection with Power Off**
  ±25V Fault Protection with ±15V Supplies
- ♦ **No Power-Supply Sequencing Required**
- ♦ **All Channels Off with Power Off**
- ♦ **Rail-to-Rail Signal Handling**
- ♦ **Output Clamped to Appropriate Supply Voltage During Fault Condition**
- ♦ **1.0kΩ typ Output Clamp Resistance During Overvoltage**
- ♦ **400Ω max On-Resistance**
- ♦ **20ns typ Fault Response Time**
- ♦ **±4.5V to ±20V Dual Supplies**
  +9V to +36V Single Supply
- ♦ **TTL/CMOS-Compatible Logic Inputs**

Note 1: COM_, EN, and A_ pins are not fault protected. Signals on COM_, EN, or A_ exceeding V+ or V- are clamped by internal diodes. Limit forward diode current to maximum current rating.

Note 2: NO_ pins are fault-protected. Signals on NO_ exceeding -25V to +25V may damage the device during power-on conditions. When the power is off the maximum voltage range is -40V to +40V.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Fault-Protected, High-Voltage, Single 4-to-1/Dual 2-to-1 Multiplexers

ELECTRICAL CHARACTERISTICS—Single +12V Supply (continued)

(V+ = +12V, V- = 0, V_{A_H} = V_{ENH} = 2.4V, V_{A_L} = V_{ENL} = 0.8V, T_A = T_{MIN} to T_{MIN}, unless otherwise noted. Typical values are at T_A = +25°C.) (Note 3)

PARAMETER	SYMBOL	CONDITIONS	T_A	MIN	TYP	MAX	UNITS
POWER SUPPLY							
Power-Supply Range	V+			9		36	V
V+ Supply Current	I+	All $V_{A\_\_}$ = V_{EN} = 0 or 12V	+25°C		75	150	µA
			C, E			250	
		All $V_{A\_\_}$ = V_{EN} = 5V	+25°C		150	275	
			C, E			375	

Note 3: Algebraic convention is used in this data sheet; the most negative value is shown in the minimum column.
Note 4: $\Delta R_{ON} = R_{ON(MAX)} - R_{ON(MIN)}$.
Note 5: Leakage parameters are 100% tested at maximum-rated hot temperature and guaranteed by correlation at T_A = 25°C.
Note 6: NO_ pins are fault protected, and COM_ pins are not fault protected. The max input voltage, on NO_ pins, depends upon the COM_ load configuration. Generally, the max input voltage is ±25V, with ±15V supplies, and a load referred to ground. For more detailed information, see the *NO_ Input Voltage section*.
Note 7: Guaranteed by design.
Note 8: Off-isolation = 20 log10 ($V_{COM\_}$ / $V_{NO\_}$), $V_{COM\_}$ = output, $V_{NO\_}$ = input to off switch.
Note 9: Between any two analog inputs.
Note 10: Leakage testing for single-supply operation is guaranteed by testing with dual supplies.

Detailed Description

The MAX4534/MAX4535 differ considerably from traditional fault-protected multiplexers, offering several advantages. First, they are constructed with two parallel FETs, allowing very low resistance when the switch is on. Second, they allow signals on the NO_ pins that are within or beyond the supply rails to be passed through the switch to the COM terminal. This allows rail-to-rail signal operation. Third, when a signal on VNO_ exceeds the supply rails (i.e., a fault condition), the voltage on COM_ is limited to the supply rails. Operation is identical for both fault polarities.

When the NO_ voltage goes beyond supply rails (fault condition), the NO_ input becomes high impedance regardless of the switch state or load resistance. When power is removed, and the fault protection is still in effect, the NO_ terminals are a virtual open circuit. The fault can be up to ±40V, with V+ = V- = 0. If the switch is on, the COM_ output current is furnished from the V+ or V- pin by "booster" FETs connected to each supply pin. These FETs can source or sink up to 10mA.

The COM_ pins are not fault-protected. If a voltage source is connected to any COM_ pin, it should be limited to the supply voltages. Exceeding the supply voltage will cause high currents to flow through the ESD protection diodes, damaging the device (see *Absolute Maximum Ratings*).

Figure 1 shows the internal construction, with the analog signal paths shown in bold. A single, normally open (NO) switch is shown. The analog switch is formed by the parallel combination of N-channel FET N1 and P-channel FET P1, which are driven on and off simultaneously, according to the input fault condition and the logic level state.

.

Fault-Protected, High-Voltage, Single 4-to-1/Dual 2-to-1 Multiplexers

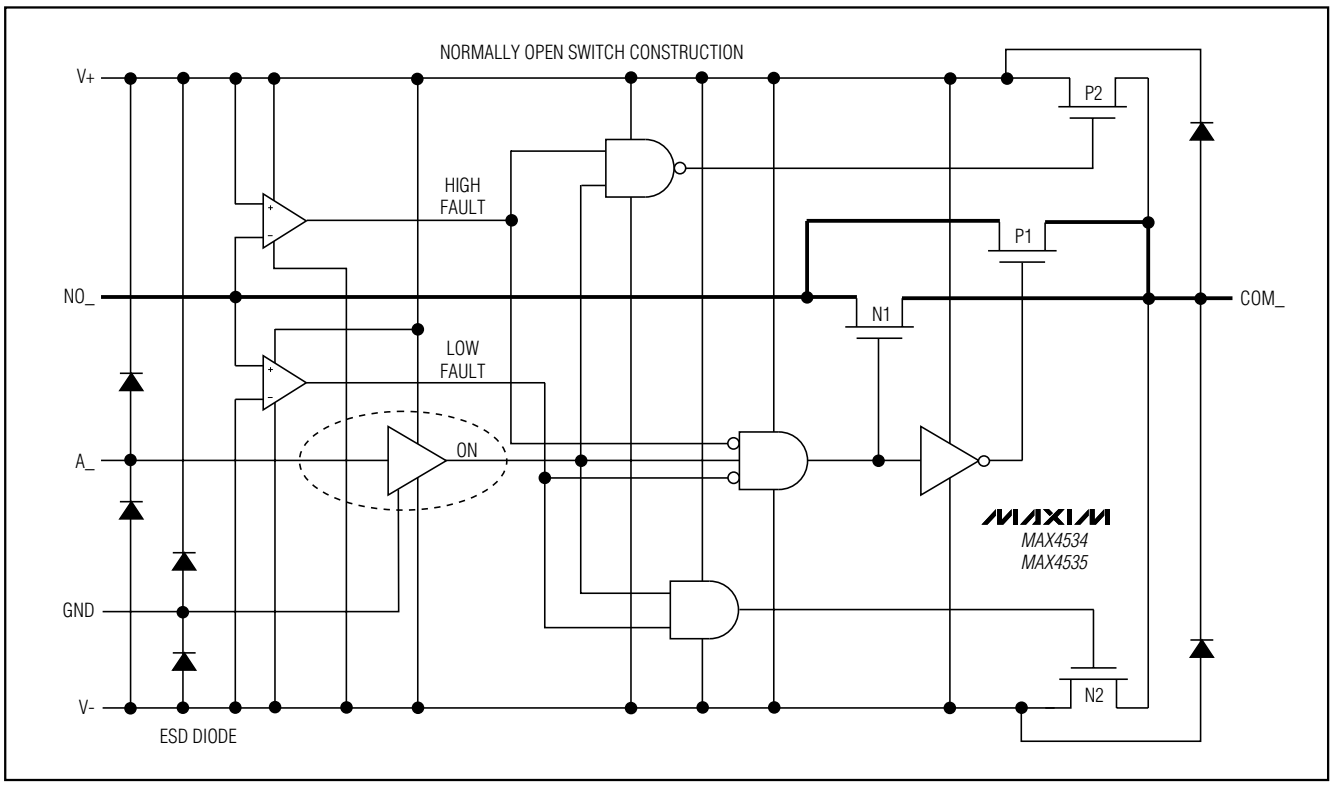

Figure 1. Functional Diagram

NO_ Input Voltage

The maximum allowable input voltage for safe operation depends on whether supplies are on or off and on the load configuration at the COM output. If COM is referred to a voltage other than ground, but within the supplies, VNO_ may range higher or lower than the supplies, provided the absolute value of VNO_ - VCOM_ is less than 40V. For example, if the load is referred to +10V at COM_, then the NO_ voltage range can be from +50V to -30V. As another example, if the load is connected to -10V at COM_, the NO_ voltage range is limited to -50V to +30V.

If the supplies are ±15V and COM is referenced to ground through a load, the maximum NO_ voltage is ±36V. If the supplies are off and the COM output is referenced to ground, the maximum NO_ voltage is ±40V.

Normal Operation

Two comparators continuously compare the voltage on the NO_ pin with V+ and V- supply voltages. When the signal on NO_ is between V+ and V-, the multiplexer behaves normally, with FETs N1 and P1 turning on and off in response to A_ signals (Figure 1). The parallel combination of N1 and P1 forms a low-value resistor between NO_ and COM_ so that signals pass equally well in either direction.

Positive Fault Condition

When the signal on NO_ exceeds V+ by about 150mV, the positive fault comparator output goes high, turning off FETs N1 and P1 (Figure 1). This makes the NO_ pin high impedance regardless of the switch state. If the switch state is “off,” all FETs turn off, and both NO_ and COM_ are high impedance. If the switch state is “on,” FET P2 turns on, clamping COM_ to V+.

Negative Fault Condition

When the signal on NO_ goes about 150mV below V-, the negative fault comparator output goes high, turning off FETs N1 and P1 (Figure 1). This makes the NO pin high impedance regardless of the switch state. If the switch state is “off,” all FETs turn off, and both NO_ and COM_ are high impedance. If the switch state is “on,” FET N2 turns on, clamping COM_ to V-.

Transient Fault Condition

When a fast rising or falling transient on NO_ exceeds V+ or V-, the output (COM_) follows the input (NO_) to the supply rail with only a few nanoseconds delay. This delay is due to the switch on-resistance and circuit capacitance to ground. When the input transient returns to within the supply rails, however, there is a longer output recovery time. For positive faults, the recovery time is typically 2.5µs. For negative faults, the recovery time is typically 1.3µs. These values depend on the COM_ output resistance and capacitance. The delays do not depend on the fault amplitude. Higher COM_ output resistance and capacitance increase the recovery times.

Non-Fault-Protected Pins

FETs N2 and P2 can source about ±10mA from V+ or V- to the COM_ pin in the fault condition (Figure 1). Ensure that if the COM_ pin is connected to a low-impedance load, the 30mA absolute maximum current rating is never exceeded, both in normal and fault conditions.

The GND, COM_, EN, and A_ pins do not have fault protection. Reverse ESD protection diodes are internally connected between GND, COM_, A_, EN, and both V+ and V-. If a signal on GND, COM_, EN, or A_ exceeds V+ or V- by more than 300mV, one of these diodes will conduct. During normal operation, these reverse-biased ESD diodes leak a few nanoamps of current to V+ and V-.

Fault Protection Voltage and Power-Off

The maximum fault voltage on the NO_ pins is ±40V from ground when the power is off. With ±15V supply voltages, the highest voltage on NO_ can be V- + 40V, and the lowest voltage on NO_ can be V+ - 40V. **Caution: Exceeding these limits can damage the IC.**

Logic-Level Thresholds

The logic-level thresholds are CMOS and TTL compatible with V+ = 4.5V to 16.5V.

Applications Information

Ground

There is no connection between the analog signal paths and GND. The analog signal paths consist of an N-channel and a P-channel MOSFET with their sources and drains paralleled, and their gates driven out of phase to V+ and V- by the logic-level translators.

V+ and GND power the internal logic and logic-level translators and set the input logic thresholds. The logic-level translators convert the logic levels to switched V+ and V- signals to drive the gates of the channel MOSFETs. This drive signal is the only connection between the power supplies and the analog signals. GND, A_, EN, and COM_ have ESD protection diodes to V+ and V-.

Supply Current Reduction

When the logic signals are driven rail-to-rail from 0 to +15V or -15V to +15V, the current consumption will be reduced from 300µA (typ) to 180µA.

Power Supplies

The MAX4534/MAX4535 operate with bipolar supplies between ±4.5V and ±20V. The V+ and V- supplies need not be symmetrical, but their sum cannot exceed the 44V absolute maximum rating.

The MAX4534/MAX4535 operate from single supplies between +9V and +36V when V- is connected to GND.
