**MAX4645/MAX4646**

## General Description

The MAX4645/MAX4646 single-pole, single-throw (SPST) analog switches feature a  $2.5\Omega$  typical on-resistance ( $R_{ON}$ ) from a +5V supply.  $R_{ON}$  is flat (0.4 $\Omega$  max) over the specified signal range. Each switch can handle Rail-to-Rail® analog signals. Off-leakage current is 0.25nA max at +25°C. These analog switches are ideal in low-distortion applications and are the preferred solution over mechanical relays in automated test equipment or applications where current switching is required. They have low power requirements, require less board space, and are more reliable than mechanical relays.

These switches operate from a +1.8V to +5V single supply, making them ideal for use in battery-powered applications. The MAX4645/MAX4646 have fast switching speeds of 12ns turn-on time ( $t_{ON}$ ) and 8ns turn-off time ( $t_{OFF}$ ).

The MAX4645 is a normally open (NO) switch, and the MAX4646 is a normally closed (NC) switch. Both are available in 5-pin SOT23, 6-pin SOT23, and 8-pin µMAX packages.

## Applications

- Battery-Powered Systems
- Audio and Video Signal Routing
- Low-Voltage Data-Acquisition Systems
- Sample-and-Hold Circuits
- Communications Circuits
- Relay Replacement

## Features

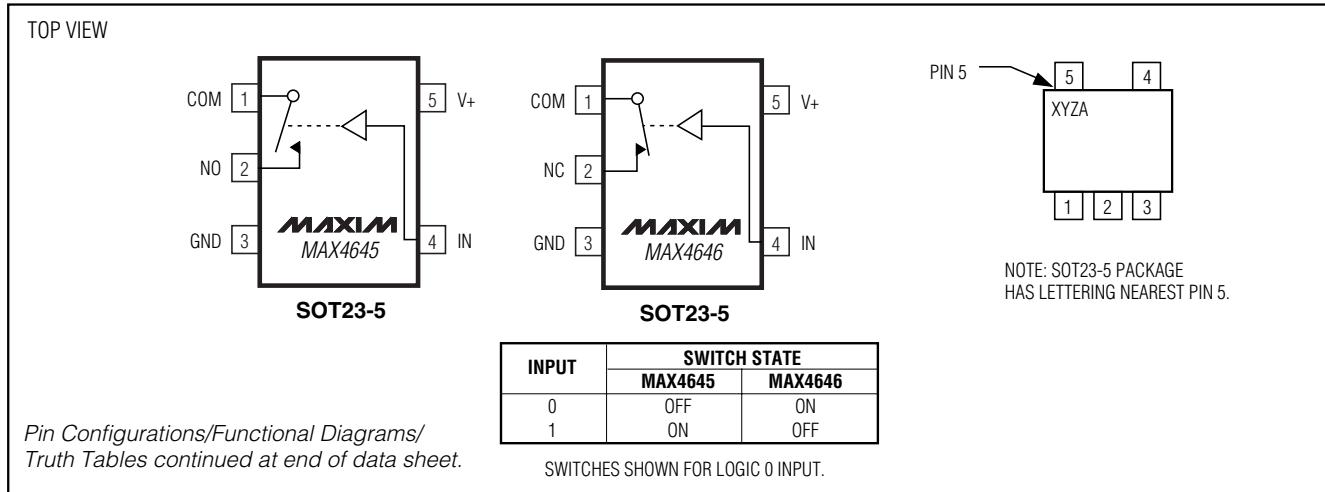

- ♦ +1.8V to +5V Single-Supply Operation
- ♦ Guaranteed  $R_{ON}$   
2.5 $\Omega$  max (5V supply)  
3.5 $\Omega$  max (3V supply)
- ♦ 1.8V Operation  
 $R_{ON}$  30 $\Omega$  typ Over Temperature  
 $t_{ON}$  40ns typ,  $t_{OFF}$  20ns typ
- ♦ Low  $R_{ON}$  Flatness: 0.4 $\Omega$  max
- ♦ Guaranteed Low Leakage Currents  
±0.25nA at +25°C
- ♦ Rail-to-Rail Output Capability
- ♦ TTL/CMOS-Logic Compatible
- ♦ -75dB Off-Isolation at 1MHz
- ♦ Low Distortion: 0.014% typ

**Note 1:** Signals on NO, NC, or COM, exceeding V+ or GND are clamped by internal diodes. Limit forward current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note 2:** The algebraic convention, where the most negative value is a minimum and the most positive value is a maximum, is used in this data sheet.

**Note 3:** SOT packages are 100% production tested at +25°C. Limits at the maximum rated temperature are guaranteed by correlation.

**Note 4:** Flatness is defined as the difference between the maximum and the minimum value of on-resistance as measured over the specified analog signal ranges.

**Note 5:** Guaranteed by design.

**Note 6:** Leakage parameters are 100% tested at +85°C and guaranteed by correlation at +25°C.

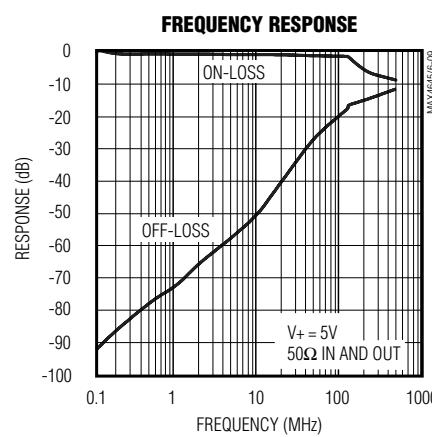

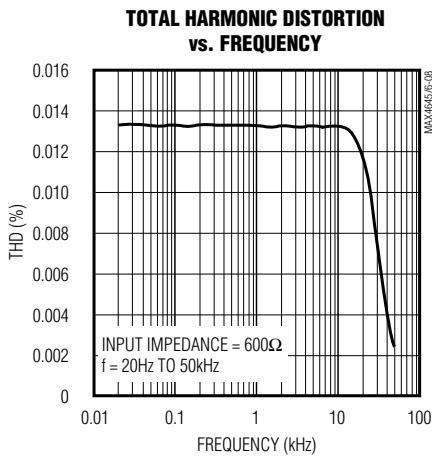

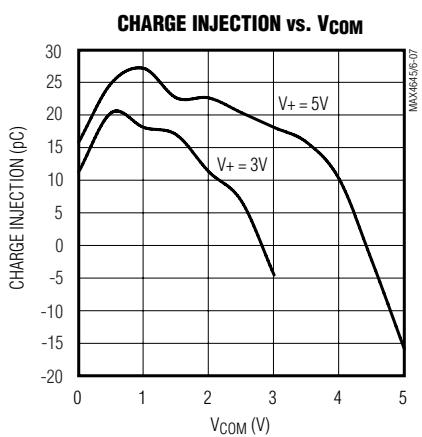

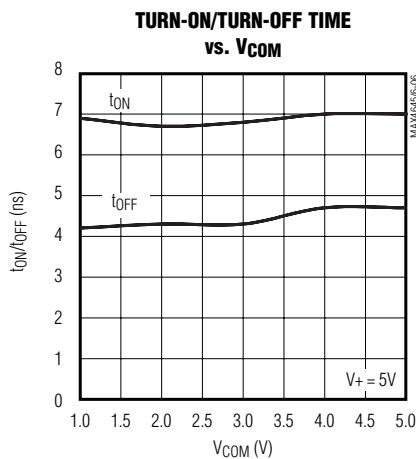

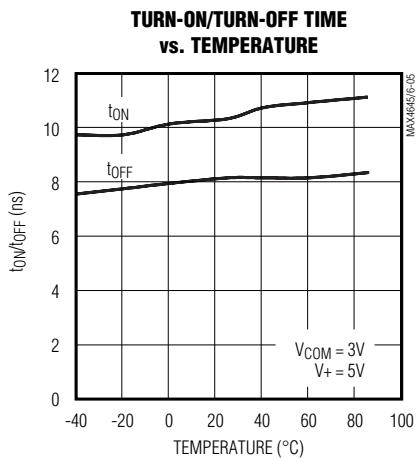

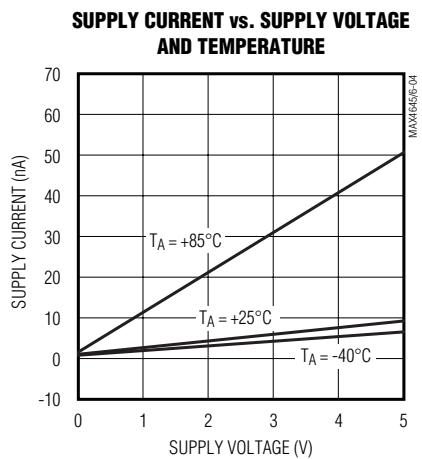

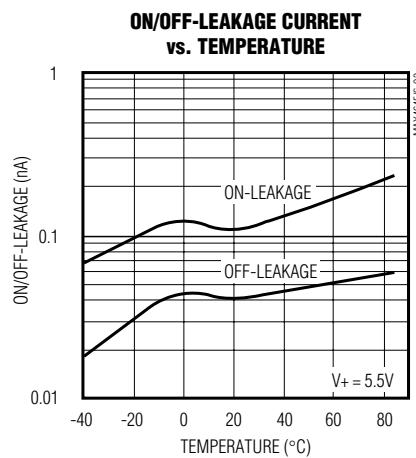

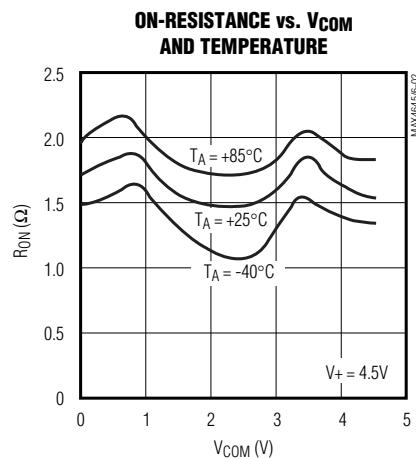

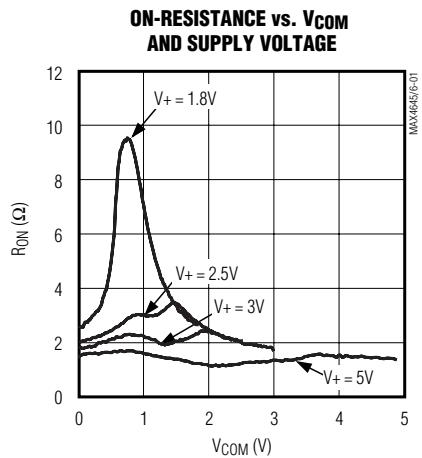

**Note 7:** Off-Isolation =  $20\log_{10}(V_{COM}/V_{NO})$ , V<sub>COM</sub> = output, V<sub>NO</sub> = input to off switch.

## Detailed Description

The MAX4645/MAX4646 are low  $2.5\Omega$  max on-resistance (at  $V_+ = 5V$ ), low-voltage analog switches that operate from a +1.8V to +5.5V single supply. CMOS switch construction allows processing analog signals that are within the supply voltage range (GND to  $V_+$ ).

## Applications Information

Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings because stresses beyond the listed ratings can cause permanent damage to the devices. Always sequence  $V_+$  on first, followed by the logic inputs, NO, or COM. If power-supply sequencing is not possible, add two small signal diodes (D1, D2) in series with the supply pins for overvoltage protection (Figure 1). Adding these diodes reduces the analog signal by one diode drop below  $V_+$  and one diode drop above GND, but does not affect the low switch resistance and low leakage characteristics of the device. Device operation is unchanged, and the difference between  $V_+$  and GND should not exceed 6V.

Although it is not required, power-supply bypassing improves noise margin and prevents switching noise from propagating from the  $V_+$  supply to other components. A  $0.1\mu F$  capacitor, connected from  $V_+$  to GND, is adequate for most applications.
