

Dual/Triple-Voltage μP Supervisory Circuits

General Description

The MAX6351–MAX6360 microprocessor (μP) supervisors with multiple reset voltages significantly improve system reliability and accuracy compared to separate ICs or discrete components. If any input supply voltage drops below its associated preset threshold, all reset outputs are asserted. In addition, the outputs are valid as long as either input supply voltage remains greater than +1.0V.

All devices in this series have an active-low debounced manual reset input. In addition, the MAX6358/MAX6359/MAX6360 offer a watchdog-timer input with a 46.4s startup timeout period and a 2.9s timeout period. The MAX6355/MAX6356/MAX6357 offer an additional voltage monitor input to monitor a third voltage.

The MAX6351 features both 3V and 5V active-low push-pull reset outputs. The MAX6353/MAX6356/MAX6359 offer a 5V active-low push-pull reset. The MAX6354/MAX6357/MAX6360 offer a 3V active-low push-pull reset. The MAX6352/MAX6355/MAX6358's reset is active-low open-drain.

All these devices are offered with a wide variety of voltage threshold levels, as shown in the *Voltage Threshold Levels* table. They are available in 5- and 6-pin SOT23 packages and operate over the extended (-40°C to +85°C) temperature range.

Voltage Threshold Levels

PART NO. SUFFIX (_)	V _{CC5} NOMINAL VOLTAGE THRESHOLD (V)	V _{CC3} NOMINAL VOLTAGE THRESHOLD (V)
LT	4.63	3.08
LS	4.63	2.93
LR	4.63	2.63
MT	4.38	3.08
MS	4.38	2.93
MR	4.38	2.63
TZ	3.08	2.32
TY	3.08	2.19
TW	3.08	1.67
TV	3.08	1.58
SZ	2.93	2.32
SY	2.93	2.19
SW	2.93	1.67
SV	2.93	1.58
UW	2.78	1.67
UV	2.78	1.58
RW	2.63	1.67
RV	2.63	1.58

Note: Standard versions are shown in bold. Sample stock is generally held on the standard versions only. Contact factory for availability.

Features

- ◆ Precision Monitoring of Multiple +1.8V, +2.5V, +3.0V, +3.3V, and +5V Power-Supply Voltages
- ◆ Precision Factory-Set Power-Supply Reset Thresholds
- ◆ 20µA Supply Current
- ◆ 100ms min Power-On Reset Pulse Width
- ◆ Debounced TTL/CMOS-Compatible Manual-Reset Input
- ◆ Watchdog Timer
 - 46.4s Startup Timeout
 - 2.9s Normal Timeout
- ◆ Fully Guaranteed Over Temperature
- ◆ Guaranteed RESET Valid to V_{CC5} = 1V or V_{CC3} = 1V
- ◆ Power-Supply Transient Immunity
- ◆ No External Components for Dual-Voltage Systems
- ◆ Small 5- and 6-Pin SOT23 Packages
- ◆ Low Cost

Applications

Computers	Intelligent Instruments
Controllers	Multivoltage Systems

Dual/Triple-Voltage μP Supervisory Circuits

ABSOLUTE MAXIMUM RATINGS

V _{CC5} , V _{CC3} to GND	-0.3V to +6V
RST (MAX6352/MAX6355/MAX6358)	-0.3V to +6V
RST, MR, WDI, RST ₅ , RSTIN (MAX6351/MAX6353/ MAX6356/MAX6359)	-0.3V to (V _{CC5} + 0.3V)
RST, RST ₃ (MAX6351/MAX6354/ MAX6357/MAX6360)	-0.3V to (V _{CC3} + 0.3V)

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{CC3} = V_{CC5} = +1.2V to +5.5V, T_A = -40°C to +85°C, unless otherwise noted. Typical values are at T_A = +25°C.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS

MAX6351-MAX6360

Dual/Triple-Voltage μP Supervisory Circuits

ELECTRICAL CHARACTERISTICS (continued)

($V_{CC3} = V_{CC5} = +1.2V$ to $+5.5V$, $T_A = -40^\circ C$ to $+85^\circ C$, unless otherwise noted. Typical values are at $T_A = +25^\circ C$.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
MR Pullup Resistance			32	63.5	100	kΩ
MR Minimum Pulse Width	t_{RP}		1			μs
MR Glitch Rejection			100			ns
MR to Reset Delay	t_{MD}		0.1			μs
ADJUSTABLE RESET COMPARATOR INPUT (MAX6355/MAX6356/MAX6357)						
RSTIN Input Threshold	V_{RSTIN}	$V_{CC5} > V_{TH5}(\text{MAX})$, $V_{CC3} > V_{TH3}(\text{MAX})$	1.20	1.22	1.24	V
		$T_A = +25^\circ C$	1.19		1.25	
RSTIN Input Current	I_{RSTIN}	$0 < V_{RSTIN} < V_{CC5} - 0.3V$	-25	25	nA	
RSTIN Hysteresis				2.5		mV

Note 1: Overtemperature limits are guaranteed by design and not production tested.

Note 2: The reset output is guaranteed to be in the correct state if either V_{CC3} or V_{CC5} is within its specified region of operation.

Note 3: The reset output(s) is asserted if either V_{CC5} or V_{CC3} drops below its associated trip point.

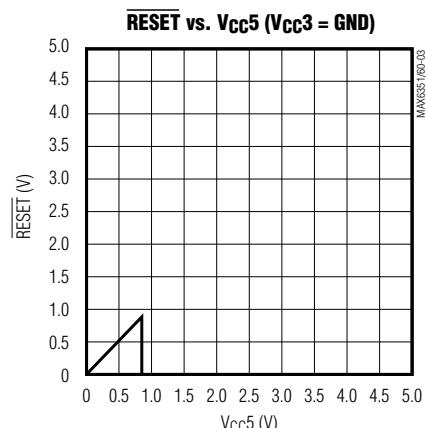

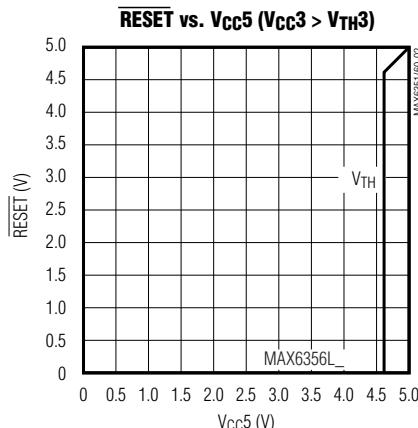

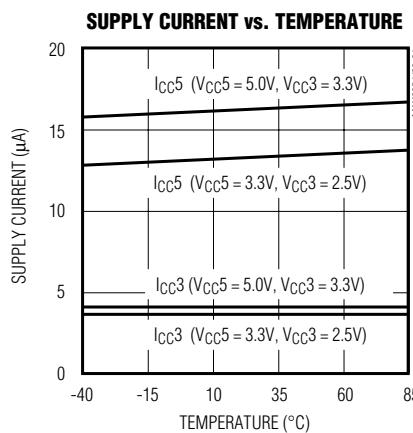

Note 4: Guaranteed by design. Not production tested.

Note 5: WDI is internally serviced within the watchdog timeout period if WDI is left unconnected.

Note 6: The WDI input current is specified as the average input current when the WDI input is driven high or low.

Typical Operating Characteristics

MAX6351-MAX6360

Dual/Triple-Voltage μP Supervisory Circuits

Pin Description

PIN				NAME	FUNCTION
MAX6351	MAX6352 MAX6353 MAX6354	MAX6355 MAX6356 MAX6357	MAX6358 MAX6359 MAX6360		
1	—	—	—	RST5	Active-Low, 5V CMOS Reset Output
—	1	1	1	$\overline{\text{RST}}$	Active-Low Reset Output. Open drain for the MAX6352/MAX6355/MAX6358, 5V push-pull for the MAX6353/MAX6356/MAX6359, and 3V push-pull for the MAX6354/MAX6357/MAX6360.
2	2	2	2	GND	Ground
3	3	3	3	$\overline{\text{MR}}$	Manual-Reset Input. Pull low to force a reset. $\overline{\text{RST}}$, RST5, and RST3 remain active as long as $\overline{\text{MR}}$ is low and for the timeout period after $\overline{\text{MR}}$ goes high. Leave unconnected or connect to V _{CC5} if unused. V $\overline{\text{MR}}$ must be below V _{CC5} .
4	4	4	4	V _{CC3}	+3.3V/+3.0V/+2.5V/+1.8V Supply Input. Powers the device when it is above V _{CC5} and monitors its own voltage.
5	—	—	—	RST3	Active-Low, 3V CMOS Reset Output
—	—	5	—	RSTIN	Undervoltage Reset Comparator Input. Asserts reset when the monitored voltage falls below 1.22V. Set the reset threshold with an external resistive divider. Connect to V _{CC5} if unused. V _{RSTIN} must be below V _{CC5} .
—	—	—	5	WDI	Watchdog Input. If WDI remains either high or low longer than the timeout period, then reset is triggered. The timer clears when reset is asserted or whenever WDI sees a rising or falling edge. Leave floating to disable it if unused.
6	5	6	6	V _{CC5}	+5.0/+3.3V/+3.0V Supply Input. Powers the device when it is above V _{CC3} and monitors its own voltage.

Dual/Triple-Voltage μP Supervisory Circuits

Detailed Description

Supply Voltages

The MAX6351–MAX6360 microprocessor (μP) supervisory circuits maintain system integrity by alerting the μP to fault conditions. These ICs monitor multiple-supply systems. The output reset state is guaranteed to remain viable while either V_{CC5} or V_{CC3} is above +1V.

Threshold Levels

All the possible input voltage threshold level combinations are indicated by a two-letter code in the *Voltage Threshold Levels* table.

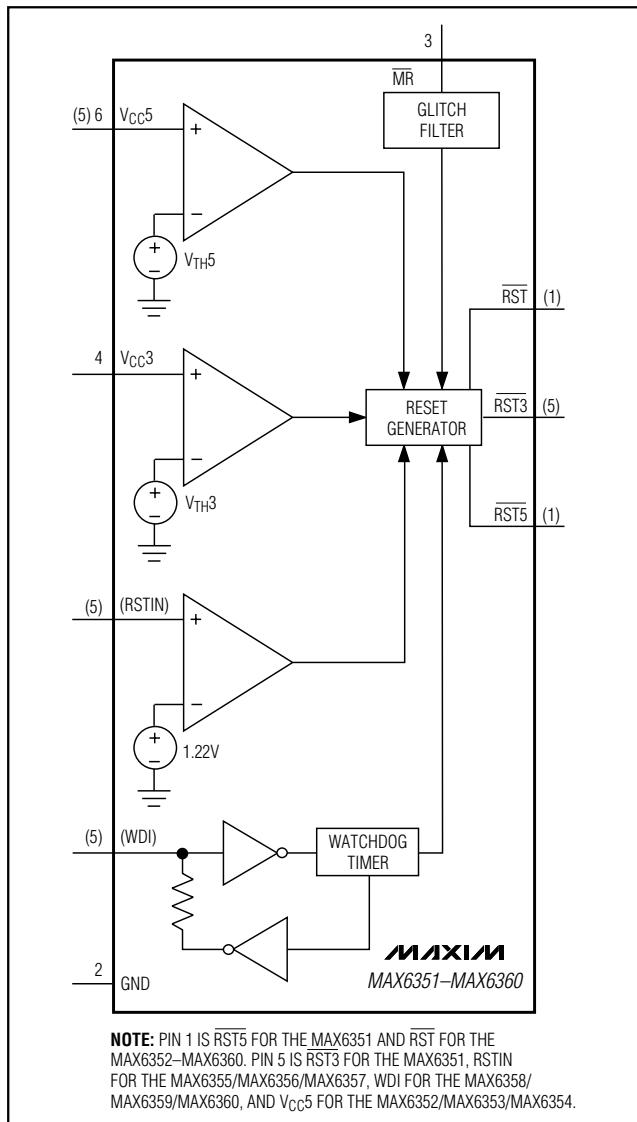

Figure 1. Functional Diagram

Reset Outputs

The MAX6351 provides a +5V active-low reset and a +3V active-low reset. The MAX6353/MAX6356/MAX6359 provide a +5V active-low push-pull reset and the MAX6354/MAX6357/MAX6360 provide a +3V active-low push-pull reset. The MAX6352/MAX6355/MAX6358 provide an active-low open-drain reset. The higher input voltages of V_{CC5} and V_{CC3} maintain the sinking capability of the low reset-output state. The reset outputs are maintained as long as either supply is above +1V.

Negative-Going V_{CC} Transients

The MAX6351–MAX6360 are designed to ignore short negative-going V_{CC5} and V_{CC3} transients. See the Maximum V_{CC} Transient Duration vs. Reset Threshold Overdrive graph in the *Typical Operating Characteristics*.

Third Input Voltage (MAX6355/MAX6356/MAX6357)

The MAX6355/MAX6356/MAX6357 provide an additional input to monitor a third voltage. The threshold voltage at RSTIN is typically 1.22V. To monitor a voltage higher than 1.22V, connect a resistive divider to the circuit as shown in Figure 2. The threshold at V_{EXT} is:

$$V_{EXT_TH} = 1.22V \left(\frac{R_1 + R_2}{R_2} \right)$$

Note that RSTIN is powered by V_{CC5}, and its voltage must therefore remain lower than or equal to V_{CC5}.

Watchdog Input (MAX6358/MAX6359/MAX6360)

The MAX6358/MAX6359/MAX6360 include a dual-mode watchdog timer to monitor μP activity. The flexible timeout architecture provides a startup mode, allowing complicated systems to complete lengthy boots, and a normal mode, allowing the supervisor to provide quick alerts when processor activity fails.

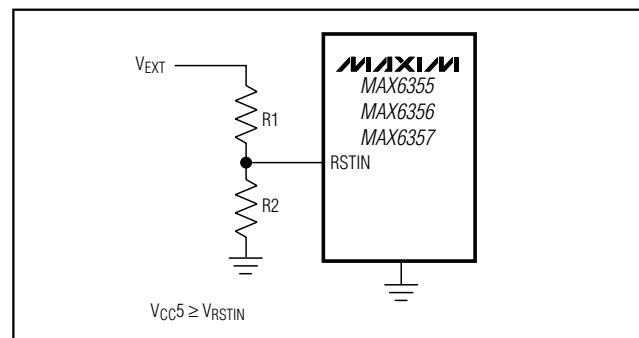

Figure 2. Monitoring a Third Voltage

Dual/Triple-Voltage µP Supervisory Circuits

During the normal operating mode, the supervisor will issue a reset pulse for the reset timeout period (140ms min) if the µP does not update the WDI with a valid transition (HIGH to LOW or LOW to HIGH) within the standard timeout period (1.6s min).

After each reset event (VCC power-up, manual reset, or watchdog reset), there is an initial watchdog startup timeout period of 25.6s. The startup mode provides an extended period for the system to power up and fully initialize all µP and system components before assuming responsibility for routine watchdog updates. The normal watchdog timeout period (1.6s min) begins at the conclusion of the startup timeout period or after the first transition on WDI before the conclusion of the start-up period (Figure 3).

Applications Information

Ensuring a Valid **RESET** Output Down to Vcc = 0

In some systems, it is necessary to ensure a valid reset even if VCC falls to 0. In these applications, use the circuit shown in Figure 4. Note that this configuration does not work for the open-drain outputs of the MAX6352/MAX6355/MAX6358.

Interfacing to µPs with Bidirectional Reset Pins

Microprocessors with bidirectional reset pins will contend with the push-pull outputs of these devices. To prevent this, connect a 4.7kΩ resistor between **RESET** and the µP's reset I/O port, as shown in Figure 5. Buffer **RESET** as shown in the figure if this reset is used by other components in the system.
