

SC70, Single/Dual Low-Voltage, Low-Power μ P Reset Circuits

MAX6381–MAX6390

General Description

The MAX6381–MAX6390 microprocessor (μ P) supervisory circuits monitor power supply voltages from +1.8V to +5.0V while consuming only 3 μ A of supply current at +1.8V. Whenever V_{CC} falls below the factory-set reset thresholds, the reset output asserts and remains asserted for a minimum reset timeout period after V_{CC} rises above the reset threshold. Reset thresholds are available from +1.58V to +4.63V, in approximately 100mV increments. Seven minimum reset timeout delays ranging from 1ms to 1200ms are available.

The MAX6381/MAX6384/MAX6387 have a push-pull active-low reset output. The MAX6382/MAX6385/MAX6388 have a push-pull active-high reset output, and the MAX6383/MAX6386/MAX6389/MAX6390 have an open-drain active-low reset output. The MAX6384/MAX6385/MAX6386 also feature a debounced manual reset input (with internal pullup resistor). The MAX6387/MAX6388/MAX6389 have an auxiliary input for monitoring a second voltage. The MAX6390 offers a manual reset input with a longer V_{CC} reset timeout period (1120ms or 1200ms) and a shorter manual reset timeout (140ms or 150ms).

The MAX6381/MAX6382/MAX6383 are available in 3-pin SC70 packages and the MAX6384–MAX6390 are available in 4-pin SC70 packages.

Applications

Computers
Controllers
Intelligent Instruments
Critical μ P and μ C Power Monitoring
Portable/Battery-Powered Equipment
Dual Voltage Systems

Pin Configurations

Features

- ◆ Factory-Set Reset Threshold Voltages Ranging from +1.58V to +4.63V in Approximately 100mV Increments
- ◆ $\pm 2.5\%$ Reset Threshold Accuracy Over Temperature (-40°C to $+125^{\circ}\text{C}$)
- ◆ Seven Reset Timeout Periods Available: 1ms, 20ms, 140ms, 280ms, 560ms, 1120ms, 1200ms (min)
- ◆ 3 Reset Output Options
 - Active-Low Push-Pull
 - Active-High Push-Pull
 - Active-Low Open-Drain
- ◆ Reset Output State Guaranteed Valid Down to $V_{CC} = 1\text{V}$
- ◆ Manual Reset Input (MAX6384/MAX6385/MAX6386)
- ◆ Auxiliary RESET IN (MAX6387/MAX6388/MAX6389)
- ◆ V_{CC} Reset Timeout (1120ms or 1200ms)/Manual Reset Timeout (140ms or 150ms) (MAX6390)
- ◆ Negative-Going V_{CC} Transient Immunity
- ◆ Low Power Consumption of 6 μ A at +3.6V and 3 μ A at +1.8V
- ◆ Pin Compatible with
 - MAX809/MAX810/MAX803/MAX6326/MAX6327/
 - MAX6328/MAX6346/MAX6347/MAX6348,
 - and MAX6711/MAX6712/MAX6713
- ◆ Tiny 3-Pin SC70 and 4-Pin SC70 Packages

Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE
MAX6381XR_D-T	-40°C to $+125^{\circ}\text{C}$	3 SC70-3
MAX6382XR_D-T	-40°C to $+125^{\circ}\text{C}$	3 SC70-3
MAX6383XR_D-T	-40°C to $+125^{\circ}\text{C}$	3 SC70-3

Note: Insert reset threshold suffix (see Reset Threshold table) after "XR" or "XS". Insert reset timeout delay (see Reset Timeout Delay table) after "D" to complete the part number. Sample stock is generally held on standard versions only (see Standard Versions table). Standard versions have an order increment requirement of 2500 pieces. Nonstandard versions have an order increment requirement of 10,000 pieces. Contact factory for availability of nonstandard versions.

*MAX6390 is available with D4 or D7 timing only.

SC70, Single/Dual Low-Voltage, Low-Power μ P Reset Circuits

Pin Description

MAX6381-MAX6390

PIN						NAME	FUNCTION
MAX6381/ MAX6383	MAX6382	MAX6384/ MAX6386/ MAX6390	MAX6385	MAX6387/ MAX6389	MAX6388		
1	1	1	1	1	1	GND	Ground
—	2	—	2	—	2	RESET	Active-High Push-Pull Reset Output. RESET changes from low to high when any monitored voltage (V_{CC} or $V_{RESETIN}$) drops below the reset threshold or \overline{MR} is pulled low. RESET remains high for the reset timeout period after monitored voltages exceed the reset thresholds or \overline{MR} is released.
2	—	2	—	2	—	\overline{RESET}	Active-Low Open-Drain/Push-Pull Reset Output. \overline{RESET} changes from high to low when any monitored voltage (V_{CC} or $V_{RESETIN}$) drops below the reset threshold or \overline{MR} is pulled low. \overline{RESET} remains low for the reset timeout period after the monitored voltages exceed the reset thresholds or \overline{MR} is released. Open-drain requires an external pullup resistor.
—	—	3	3	—	—	\overline{MR}	Active-Low Manual Reset Input. Drive low to force a reset. Reset remains active as long as \overline{MR} is low and for the reset timeout period after \overline{MR} is released. Leave unconnected or connect to V_{CC} if unused. \overline{MR} has an internal $63k\Omega$ ($1.35k\Omega$ for MAX6390) pullup resistor to V_{CC} .
—	—	—	—	3	3	RESET IN	Auxiliary Reset Input. High-impedance input to the auxiliary reset comparator. Connect RESET IN to the center point of an external resistor voltage-divider network to set the reset threshold voltage. Reset asserts when either V_{CC} or RESET IN falls below its threshold voltage.
3	3	4	4	4	4	V_{CC}	Supply Voltage for the device and input for fixed V_{CC} reset threshold monitor.

SC70, Single/Dual Low-Voltage, Low-Power μ P Reset Circuits

Detailed Description

RESET Output

A μ P reset input starts the μ P in a known state. These μ P supervisory circuits assert reset to prevent code execution errors during power-up, power-down, or brownout conditions.

Reset asserts when V_{CC} is below the reset threshold; once V_{CC} exceeds the reset threshold, an internal timer keeps the reset output asserted for the reset timeout period. After this interval, reset output deasserts. Reset output is guaranteed to be in the correct logic state for $V_{CC} \geq 1V$.

Manual Reset Input (MAX6384/MAX6385/MAX6386/MAX6390)

Many μ P-based products require manual reset capability, allowing the operator, a test technician, or external logic circuitry to initiate a reset. A logic low on \overline{MR} asserts reset. Reset remains asserted while \overline{MR} is low, and for the reset active timeout period (t_{RP}) after \overline{MR} returns high. This input has an internal 63k Ω pullup resistor (1.35k Ω for MAX6390), so it can be left unconnected if it is not used. \overline{MR} can be driven with TTL or CMOS logic levels, or with open-drain/collector outputs. Connect a normally open momentary switch from \overline{MR} to GND to create a manual-reset function; external debounce circuitry is not required. If \overline{MR} is driven from long cables or if the device is used in a noisy environment, connecting a 0.1 μ F capacitor from \overline{MR} to GND provides additional noise immunity.

RESET IN Comparator (MAX6387/MAX6388/MAX6389)

RESET IN is compared to an internal +1.27V reference. If the voltage at RESET IN is less than 1.27V, reset asserts. Use the RESET IN comparator as a user-adjustable reset detector or as a secondary power-supply monitor by implementing a resistor-divider at RESET IN (shown in Figure 1). Reset asserts when either V_{CC} or RESET IN falls below its respective threshold voltage. Use the following equation to set the threshold:

$$V_{INTH} = V_{THRST} (R1/R2 + 1)$$

where $V_{THRST} = +1.27V$. To simplify the resistor selection, choose a value of $R2$ and calculate $R1$:

$$R1 = R2 [(V_{INTH}/V_{THRST}) - 1]$$

Since the input current at RESET IN is 50nA (max), large values can be used for $R2$ with no significant loss in accuracy.

Reset Thresholds (-40°C to +125°C)

Applications Information

Negative-Going V_{CC} Transients

In addition to issuing a reset to the μ P during power-up, power-down, and brownout conditions, the MAX6381–MAX6390 are relatively immune to short duration negative-going V_{CC} transients (glitches).

The *Typical Operating Characteristics* section shows the Maximum Transient Durations vs. Reset Comparator Overdrive, for which the MAX6381–MAX6390 do not generate a reset pulse. This graph was generated using

SC70, Single/Dual Low-Voltage, Low-Power μ P Reset Circuits

D2	20ms
D3	140ms
D5	280ms
D6	560ms
D4	1120ms
D7	1200ms
MAX6390XSD4	1120/140ms *
MAX6390XSD7	1200/150ms *

* The MAX6390 has a 1120ms or 1200ms *RESET* timeout and a 140ms or 150ms manual reset timeout

a negative-going pulse applied to V_{CC} , starting above the actual reset threshold and ending below it by the magnitude indicated (reset comparator overdrive). The graph indicates the typical maximum pulse width a negative-going V_{CC} transient may have without causing a reset pulse to be issued. As the magnitude of the transient increases (goes farther below the reset threshold), the maximum allowable pulse width decreases. A 0.1 μ F capacitor mounted as close as possible to V_{CC} provides additional transient immunity.

Ensuring a Valid RESET Output Down to $V_{CC} = 0$

The MAX6381–MAX6390 are guaranteed to operate properly down to $V_{CC} = 1V$. In applications that require valid reset levels down to $V_{CC} = 0$, a pulldown resistor to active-low outputs (push/pull only, Figure 2) and a pullup resistor to active-high outputs (push/pull only) will ensure that the reset line is valid while the reset output can no longer sink or source current. This scheme does

not work with the open-drain outputs of the MAX6383/MAX6386/MAX6389/MAX6390. The resistor value used is not critical, but it must be small enough not to load the reset output when V_{CC} is above the reset threshold. For most applications, 100k Ω is adequate.
