

2.7V 10-Bit A/D Converter with SPI™ Serial Interface

Features

- 10-bit resolution
- ± 1 LSB max DNL
- ± 1 LSB max INL
- On-chip sample and hold
- SPI™ serial interface (modes 0,0 and 1,1)
- Single supply operation: 2.7V - 5.5V
- 200 kps sampling rate at 5V
- 75 kps sampling rate at 2.7V
- Low power CMOS technology
 - 5 nA typical standby current, 2 μ A max
 - 500 μ A max active current at 5V
- Industrial temp range: -40°C to +85°C
- 8-pin PDIP, SOIC, MSOP and TSSOP packages

Applications

- Sensor Interface
- Process Control
- Data Acquisition
- Battery Operated Systems

Description

The Microchip Technology Inc. MCP3001 is a successive approximation 10-bit A/D converter (ADC) with on-board sample and hold circuitry. The device provides a single pseudo-differential input. Differential Nonlinearity (DNL) and Integral Nonlinearity (INL) are both specified at ± 1 LSB max. Communication with the device is done using a simple serial interface compatible with the SPI protocol. The device is capable of sample rates up to 200 kps at a clock rate of 2.8 MHz. The MCP3001 operates over a broad voltage range (2.7V - 5.5V). Low current design permits operation with a typical standby current of only 5 nA and a typical active current of 400 μ A. The device is offered in 8-pin PDIP, MSOP, TSSOP and 150 mil SOIC packages.

Package Types

PDIP, MSOP, SOIC, TSSOP

MCP3001

1.0 ELECTRICAL CHARACTERISTICS

1.1 Maximum Ratings*

V_{DD} 7.0V

All inputs and outputs w.r.t. V_{SS} -0.6V to V_{DD} +0.6V

Storage temperature -65°C to +150°C

Ambient temp. with power applied -65°C to +125°C

ESD protection on all pins (HBM)..... > 4kV

*Notice: Stresses above those listed under “Maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

PIN FUNCTION TABLE

Name	Function
V_{DD}	+2.7V to 5.5V Power Supply
V_{SS}	Ground
IN+	Positive Analog Input
IN-	Negative Analog Input
CLK	Serial Clock
D_{OUT}	Serial Data Out
$\overline{CS}/SHDN$	Chip Select/Shutdown Input
V_{REF}	Reference Voltage Input

ELECTRICAL CHARACTERISTICS

All parameters apply at $V_{DD} = 5V$, $V_{SS} = 0V$, $V_{REF} = 5V$, $T_{AMB} = -40^{\circ}C$ to $+85^{\circ}C$, $f_{SAMPLE} = 200$ kps and $f_{CLK} = 14 * f_{SAMPLE}$, unless otherwise noted. Typical values apply for $V_{DD} = 5V$, $T_{AMB} = 25^{\circ}C$, unless otherwise noted.

Parameter	Sym	Min	Typ	Max	Units	Conditions
Conversion Rate:

3.0 PIN DESCRIPTIONS

3.1 IN+

Positive analog input. This input can vary from IN- to $V_{REF} + IN-$.

3.2 IN-

Negative analog input. This input can vary ± 100 mV from V_{SS} .

3.3 $\overline{CS}/SHDN$ (Chip Select/Shutdown)

The $\overline{CS}/SHDN$ pin is used to initiate communication with the device when pulled low and will end a conversion and put the device in low power standby when pulled high. The $\overline{CS}/SHDN$ pin must be pulled high between conversions.

3.4 CLK (Serial Clock)

The SPI clock pin is used to initiate a conversion and to clock out each bit of the conversion as it takes place. See Section 6.2 for constraints on clock speed.

3.5 DOUT (Serial Data output)

The SPI serial data output pin is used to shift out the results of the A/D conversion. Data will always change on the falling edge of each clock as the conversion takes place.

4.0 DEVICE OPERATION

The MCP3001 A/D converter employs a conventional SAR architecture. With this architecture, a sample is acquired on an internal sample/hold capacitor for 1.5 clock cycles starting on the first rising edge of the serial clock after \overline{CS} has been pulled low. Following this sample time, the input switch of the converter opens and the device uses the collected charge on the internal sample and hold capacitor to produce a serial 10-bit digital output code. Conversion rates of 200 ksp/s are possible on the MCP3001. See Section 6.2 for information on minimum clock rates. Communication with the device is done using a 3-wire SPI-compatible interface.

4.1 Analog Inputs

The MCP3001 provides a single pseudo-differential input. The IN+ input can range from IN- to $(V_{REF} + IN-)$. The IN- input is limited to ± 100 mV from the V_{SS} rail. The IN- input can be used to cancel small signal common-mode noise which is present on both the IN+ and IN- inputs.

For the A/D Converter to meet specification, the charge holding capacitor, C_{SAMPLE} must be given enough time to acquire a 10-bit accurate voltage level during the 1.5 clock cycle sampling period. The analog input model is shown in Figure 4-1.

In this diagram, it is shown that the source impedance (R_S) adds to the internal sampling switch, (R_{SS}) impedance, directly affecting the time that is required to charge the capacitor, C_{SAMPLE} . Consequently, a larger source impedance increases the offset, gain, and integral linearity errors of the conversion.

Ideally, the impedance of the signal source should be near zero. This is achievable with an operational amplifier such as the MCP601, which has a closed loop output impedance of tens of ohms. The adverse affects of higher source impedances are shown in Figure 4-2.

If the voltage level of IN+ is equal to or less than IN-, the resultant code will be 000h. If the voltage at IN+ is equal to or greater than $\{[V_{REF} + (IN-)] - 1 \text{ LSB}\}$, then the output code will be 3FFh. If the voltage level at IN- is more than 1 LSB below V_{SS} , then the voltage level at the IN+ input will have to go below V_{SS} to see the 000h output code. Conversely, if IN- is more than 1 LSB above V_{SS} , then the 3FFh code will not be seen unless the IN+ input level goes above V_{REF} level.

4.2 Reference Input

The reference input (V_{REF}) determines the analog input voltage range and the LSB size, as shown below.

$$LSB \text{ Size} = \frac{V_{REF}}{1024}$$

As the reference input is reduced, the LSB size is reduced accordingly. The theoretical digital output code produced by the A/D Converter is a function of the analog input signal and the reference input as shown below.

$$Digital \text{ Output Code} = \frac{1024 * V_{IN}}{V_{REF}}$$

where:

$$V_{IN} = \text{analog input voltage} = V(IN+) - V(IN-)$$

$$V_{REF} = \text{reference voltage}$$

When using an external voltage reference device, the system designer should always refer to the manufacturer's recommendations for circuit layout. Any instability in the operation of the reference device will have a direct effect on the operation of the ADC.

MCP3001

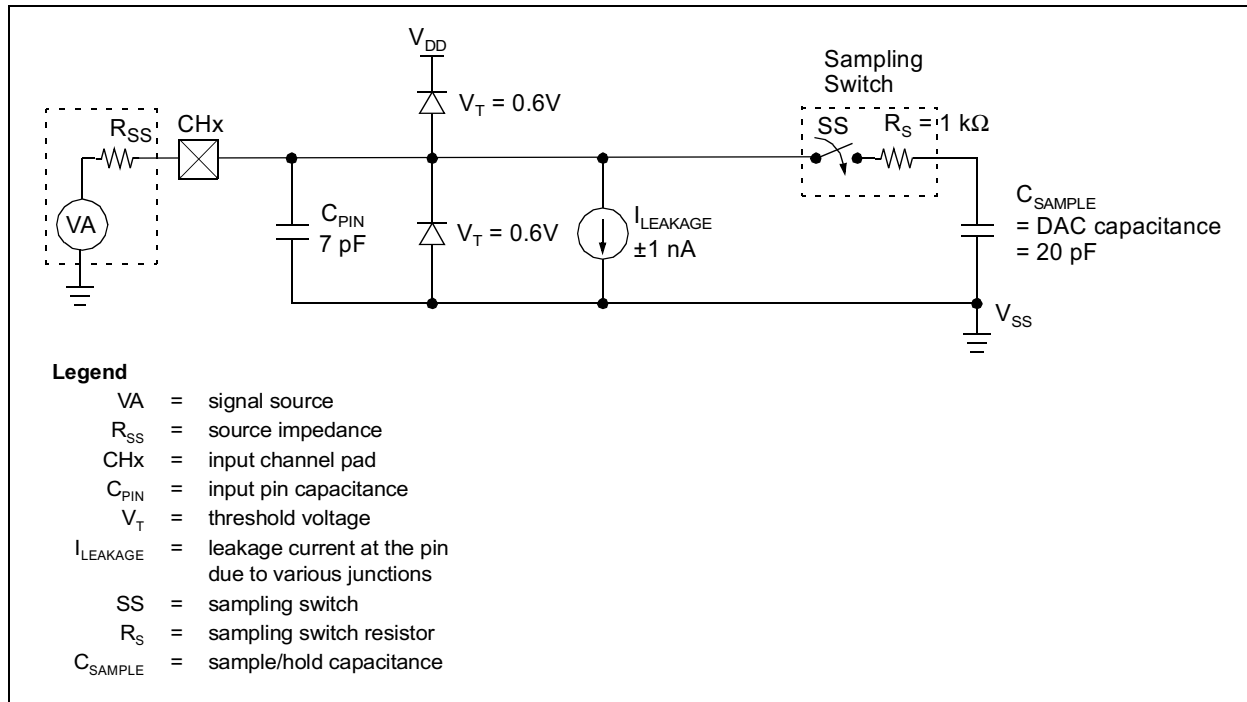

FIGURE 4-1: Analog Input Model.

FIGURE 4-2: Maximum Clock Frequency vs. Input Resistance (R_S) to maintain less than a 0.1LSB deviation in INL from nominal conditions.

5.0 SERIAL COMMUNICATIONS

Communication with the device is done using a standard SPI compatible serial interface. Initiating communication with the MCP3001 begins with the \overline{CS} going low. If the device was powered up with the \overline{CS} pin low, it must be brought high and back low to initiate communication. The device will begin to sample the analog input on the first rising edge after \overline{CS} goes low. The sample period will end in the falling edge of the second clock, at which time the device will output a low null bit. The next 10 clocks will output the result of the conversion with MSB first, as shown in Figure 5-1. Data is always output from the device on the falling edge of the clock. If all 10 data bits have been transmitted and the

device continues to receive clocks while the \overline{CS} is held low, the device will output the conversion result LSB first, as shown in Figure 5-2. If more clocks are provided to the device while \overline{CS} is still low (after the LSB first data has been transmitted), the device will clock out zeros indefinitely.

If it is desired, the \overline{CS} can be raised to end the conversion period at any time during the transmission. Faster conversion rates can be obtained by using this technique if not all the bits are captured before starting a new cycle. Some system designers use this method by capturing only the highest order 8 bits and 'throwing away' the lower 2 bits.

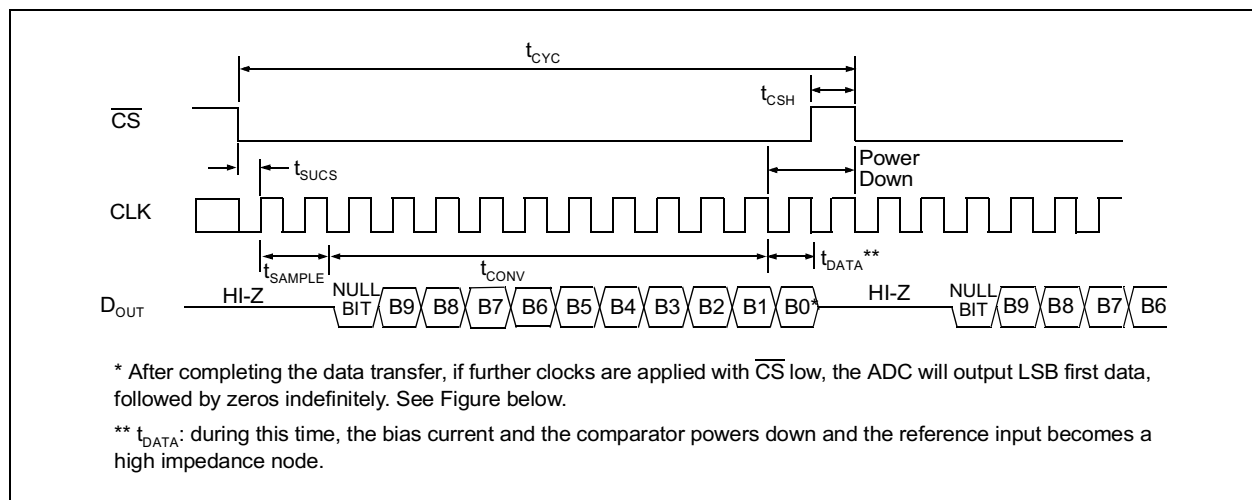

FIGURE 5-1: Communication with MCP3001 (MSB first Format).

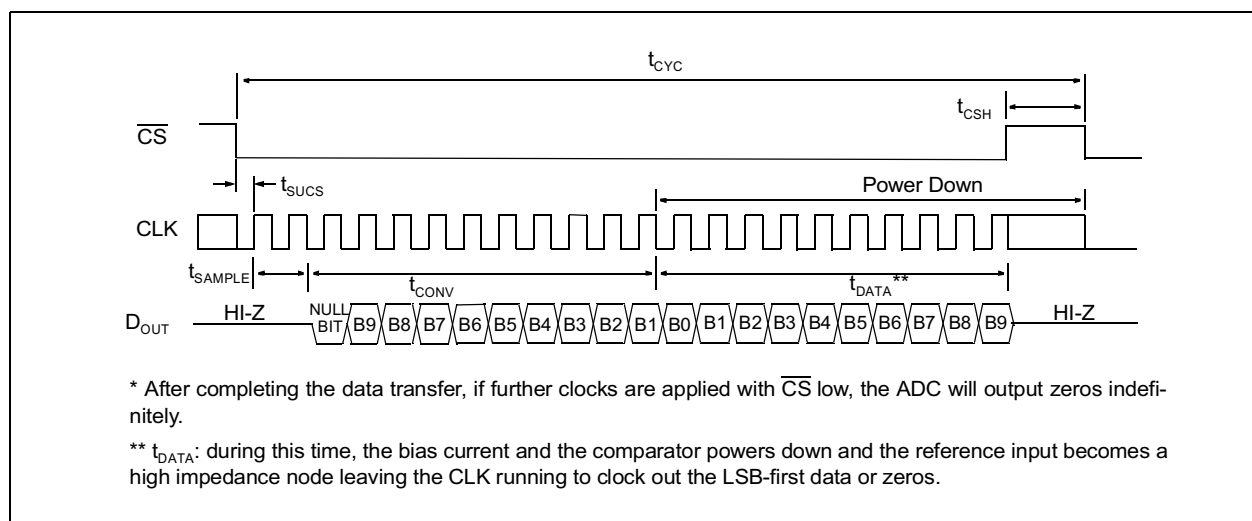

FIGURE 5-2: Communication with MCP3001 (LSB first Format).

6.0 APPLICATIONS INFORMATION

MCP3001

6.1 Using the MCP3001 with Microcontroller SPI Ports

With most microcontroller SPI ports, it is required to clock out eight bits at a time. If this is the case, it will be necessary to provide more clocks than are required for the MCP3001. As an example, Figure 6-1 and Figure 6-2 show how the MCP3001 can be interfaced to a microcontroller with a standard SPI port. Since the MCP3001 always clocks data out on the falling edge of clock, the MCU SPI port must be configured to match this operation. SPI Mode 0,0 (clock idles low) and SPI Mode 1,1 (clock idles high) are both compatible with the MCP3001. Figure 6-1 depicts the operation shown in SPI Mode 0,0, which requires that the CLK from the microcontroller idles in the 'low' state. As shown in the diagram, the MSB is clocked out of the ADC on the falling edge of the third clock pulse. After the first eight clocks have been sent to the device, the microcontroller's receive buffer will contain two unknown bits (the

output is at high impedance for the first two clocks), the null bit and the highest order five bits of the conversion. After the second eight clocks have been sent to the device, the MCU receive register will contain the lowest order five bits and the B1-B4 bits repeated as the ADC has begun to shift out LSB first data with the extra clocks. Typical procedure would then call for the lower order byte of data to be shifted right by three bits to remove the extra B1-B4 bits. The B9-B5 bits are then rotated 3 bits to the right with B7-B5 rotating from the high order byte to the lower order byte. Easier manipulation of the converted data can be obtained by using this method.

Figure 6-2 shows SPI Mode 1,1 communication which requires that the clock idles in the high state. As with mode 0,0, the ADC outputs data on the falling edge of the clock and the MCU latches data from the ADC in on the rising edge of the clock.

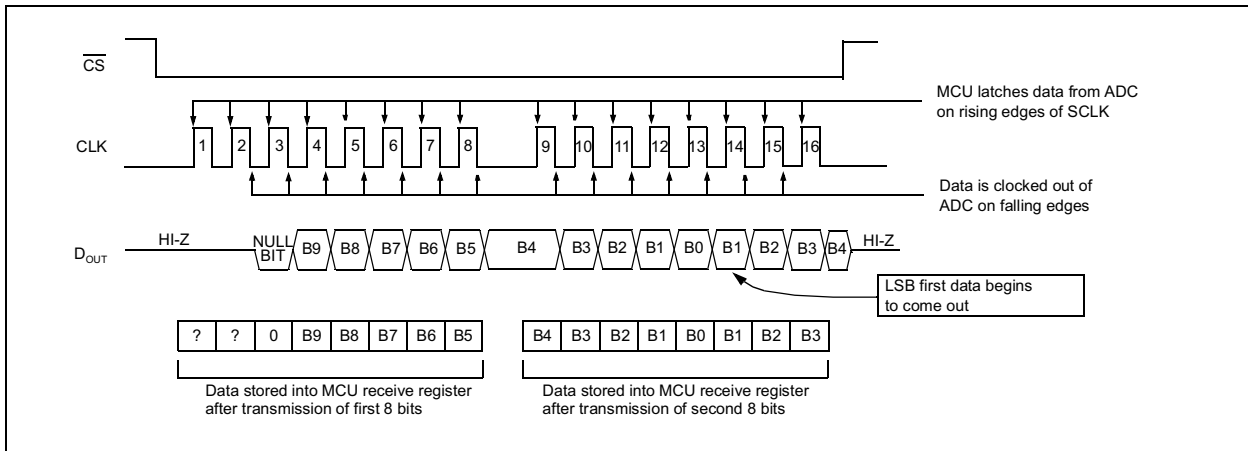

FIGURE 6-1: SPI Communication with the MCP3001 using 8-bit segments (Mode 0,0: SCLK idles low).

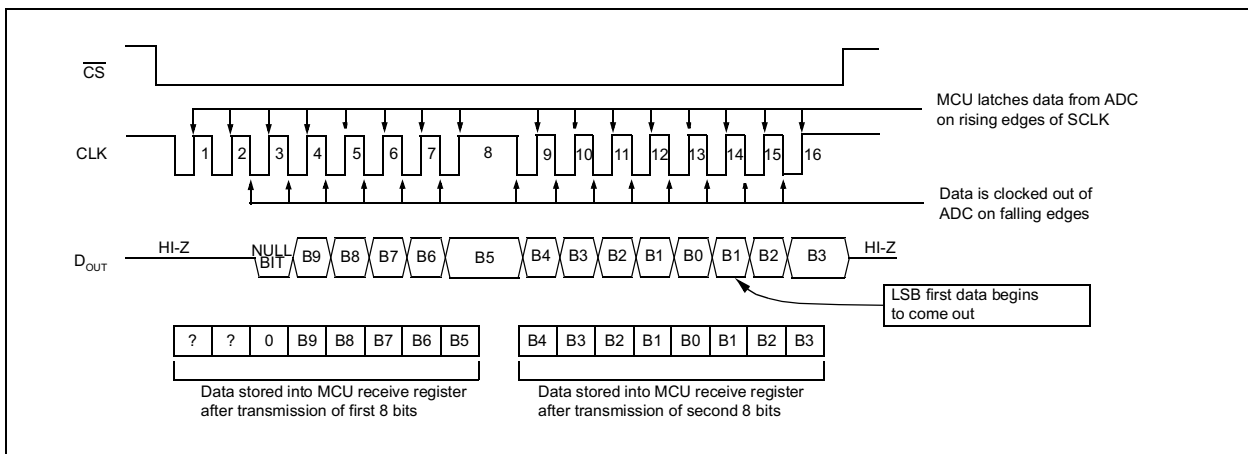

FIGURE 6-2: SPI Communication with the MCP3001 using 8-bit segments (Mode 1,1: SCLK idles high).

6.2 Maintaining Minimum Clock Speed

When the MCP3001 initiates the sample period, charge is stored on the sample capacitor. When the sample period is complete, the device converts one bit for each clock that is received. It is important for the user to note that a slow clock rate will allow charge to bleed off the sample cap while the conversion is taking place. At 85°C (worst case condition), the part will maintain proper charge on the sample cap for 700 μ s at $V_{DD} = 2.7$ V and 1.5 ms at $V_{DD} = 5$ V. This means that at $V_{DD} = 2.7$ V, the time it takes to transmit the first 14 clocks must not exceed 700 μ s. Failure to meet this criterion may induce linearity errors into the conversion outside the rated specifications.

6.3 Buffering/Filtering the Analog Inputs

If the signal source for the ADC is not a low impedance source, it will have to be buffered or inaccurate conversion results may occur. See Figure 4-2. It is also recommended that a filter be used to eliminate any signals that may be aliased back into the conversion results. This is illustrated in Figure 6-3 where an op amp is used to drive, filter and gain the analog input of the MCP3001. This amplifier provides a low impedance source for the converter input and a low pass filter, which eliminates unwanted high frequency noise.

Low pass (anti-aliasing) filters can be designed using Microchip's interactive FilterLab™ software. FilterLab will calculate capacitor and resistor values, as well as determine the number of poles that are required for the application. For more information on filtering signals, see the application note AN699 "Anti-Aliasing Analog Filters for Data Acquisition Systems."

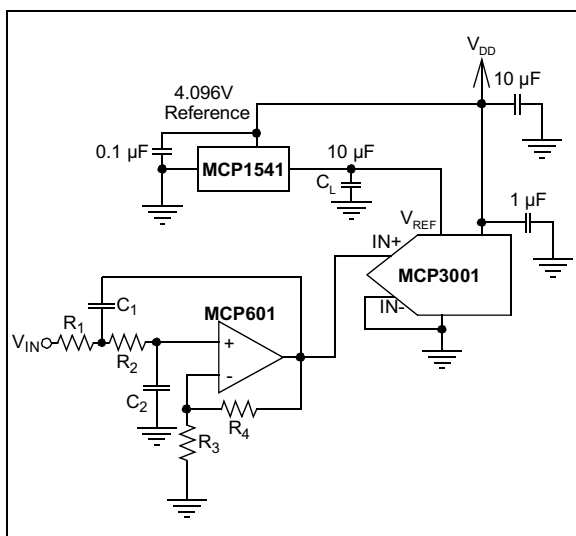

FIGURE 6-3: The MCP601 operational amplifier is used to implement a 2nd order anti-aliasing filter for the signal being converted by the MCP3001.

6.4 Layout Considerations

When laying out a printed circuit board for use with analog components, care should be taken to reduce noise wherever possible. A bypass capacitor should always be used with this device and should be placed as close as possible to the device pin. A bypass capacitor value of 1 μ F is recommended.

Digital and analog traces should be separated as much as possible on the board and no traces should run underneath the device or the bypass capacitor. Extra precautions should be taken to keep traces with high frequency signals (such as clock lines) as far as possible from analog traces.

Use of an analog ground plane is recommended in order to keep the ground potential the same for all devices on the board. Providing V_{DD} connections to devices in a "star" configuration can also reduce noise by eliminating current return paths and associated errors. See Figure 6-4. For more information on layout tips when using ADC, refer to AN-688 "Layout Tips for 12-Bit A/D Converter Applications".

FIGURE 6-4: V_{DD} traces arranged in a 'Star' configuration in order to reduce errors caused by current return paths.

ON-LINE SUPPORT

Microchip provides on-line support on the Microchip World Wide Web (WWW) site.

The web site is used by Microchip as a means to make files and information easily available to customers. To view the site, the user must have access to the Internet and a web browser, such as Netscape or Microsoft Explorer. Files are also available for FTP download from our FTP site.

Connecting to the Microchip Internet Web Site

The Microchip web site is available by using your favorite Internet browser to attach to:

www.microchip.com

The file transfer site is available by using an FTP service to connect to:

<ftp://ftp.microchip.com>

The web site and file transfer site provide a variety of services. Users may download files for the latest Development Tools, Data Sheets, Application Notes, User's Guides, Articles and Sample Programs. A variety of Microchip specific business information is also available, including listings of Microchip sales offices, distributors and factory representatives. Other data available for consideration is:

- Latest Microchip Press Releases
- Technical Support Section with Frequently Asked Questions
- Design Tips
- Device Errata
- Job Postings
- Microchip Consultant Program Member Listing
- Links to other useful web sites related to Microchip Products
- Conferences for products, Development Systems, technical information and more
- Listing of seminars and events

Systems Information and Upgrade Hot Line

The Systems Information and Upgrade Line provides system users a listing of the latest versions of all of Microchip's development systems software products. Plus, this line provides information on how customers can receive any currently available upgrade kits. The Hot Line Numbers are:

1-800-755-2345 for U.S. and most of Canada, and

1-480-792-7302 for the rest of the world.

013001

READER RESPONSE

Please list the following information, and use this outline to provide us with your comments about this Data Sheet.

Total Pages Sent

From: Name _____

Company _____

Address _____

City / State / ZIP / Country _____

Telephone: (____) _____ - _____ FAX: (____) _____ - _____

Would you like a reply? ____Y ____N

Literature Number: **DS21293B**

Questions:

1. What are the best features of this document?

2. How does this document meet your hardware and software development needs?

3. Do you find the organization of this data sheet easy to follow? If not, why?

4. What additions to the data sheet do you think would enhance the structure and subject?

5. What deletions from the data sheet could be made without affecting the overall usefulness?

6. Is there any incorrect or misleading information (what and where)?

7. How would you improve this document?

8. How would you improve our software, systems, and silicon products?

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

Sales and Support

Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site (www.microchip.com)

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

New Customer Notification System

Register on our web site (www.microchip.com/cn) to receive the most current information on our products.
