Multistandard Sound Processor Family with Virtual Dolby Surround

Release Note: Revision bars indicate significant changes to the previous edition. The hardware and software description in this document is valid for the MSP 34x1G version B8 and following versions.

1. Introduction

The MSP 34x1G family of single-chip Multistandard Sound Processors covers the sound processing of all analog TV-Standards worldwide, as well as the NICAM digital sound standards. The full TV sound processing, starting with analog sound IF signal-in, down to processed analog AF-out, is performed on a single chip. Figure 1–1 shows a simplified functional block diagram of the MSP 34x1G.

The MSP 34x1G has all functions of the MSP 34x0G with the addition of a virtual surround sound feature.

Surround sound can be reproduced to a certain extent with two loudspeakers. The MSP 34x1G includes the Micronas virtualizer algorithm “3D-PANORAMA” which has been approved by the Dolby¹⁾ Laboratories for compliance with the “Virtual Dolby Surround” technology. In addition, the MSP 34x1G includes the “PANORAMA” algorithm.

These TV sound processing ICs include versions for processing the multichannel television sound (MTS)

signal conforming to the standard recommended by the Broadcast Television Systems Committee (BTSC). The DBX noise reduction, or alternatively, Micronas Noise Reduction (MNR) is performed alignment free.

Other processed standards are the Japanese FM-FM multiplex standard (EIA-J) and the FM Stereo Radio standard.

Current ICs have to perform adjustment procedures in order to achieve good stereo separation for BTSC and EIA-J. The MSP 34x1G has optimum stereo performance without any adjustments.

All MSP 34xxG versions are pin compatible to the MSP 34xxD. Only minor modifications are necessary to adapt a MSP 34xxD controlling software to the MSP 34xxG. The MSP 34x1G further simplifies controlling software. Standard selection requires a single I²C transmission only.

The MSP 34x1G has built-in automatic functions: The IC is able to detect the actual sound standard automatically (Automatic Standard Detection). Furthermore, pilot levels and identification signals can be evaluated internally with subsequent switching between mono/stereo/bilingual; no I²C interaction is necessary (Automatic Sound Selection).

The ICs are produced in submicron CMOS technology. The MSP 34x1G is available in the following packages: PLCC68 (not intended for new designs), PSDIP64, PSDIP52, PQFP80, and PLQFP64.

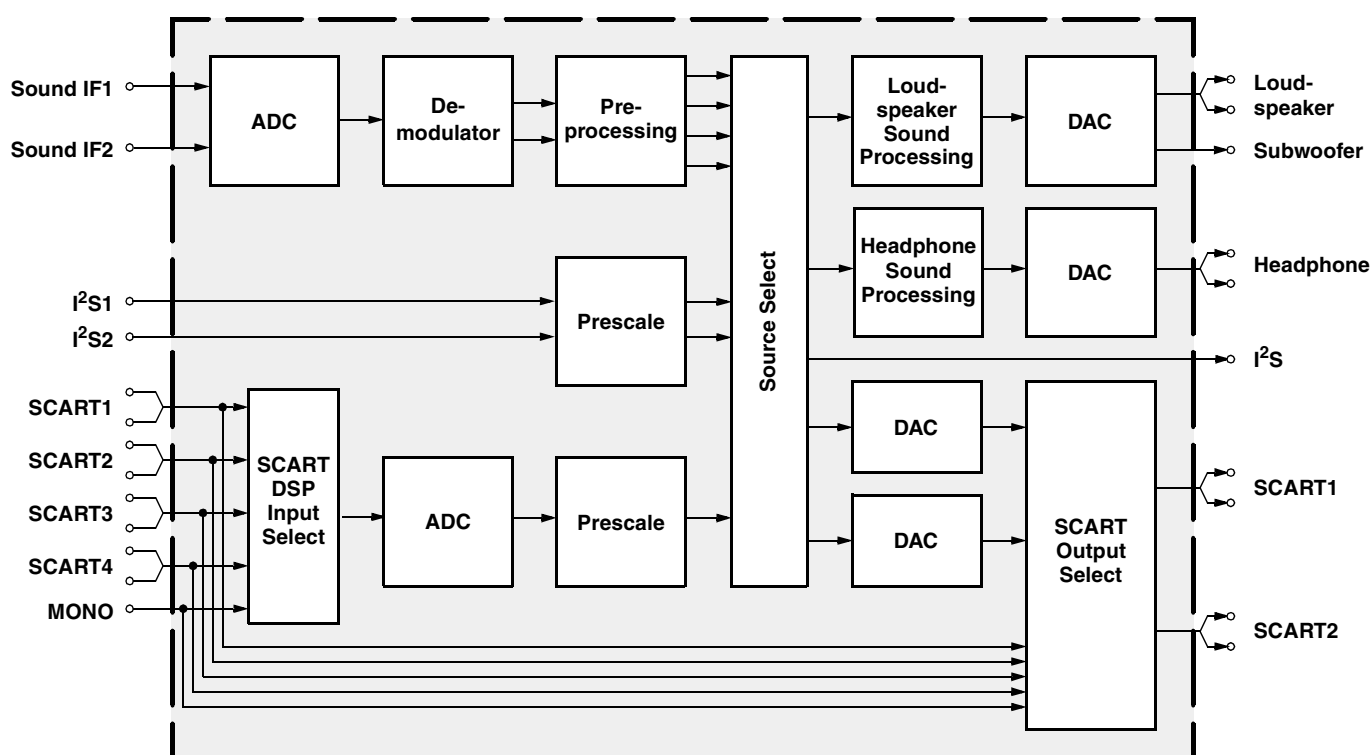

Fig. 1–1: Simplified functional block diagram of the MSP 34x1G

1.1. Features of the MSP 34x1G Family and Differences to MSP 34xxD

Feature (New features not available for MSP 34xxD are shaded gray.)	3401	3411	3421	3441	3451	3461
3D-PANORAMA virtualizer (approved by Dolby Laboratories) with noise generator	X	X	X	X	X	X
PANORAMA virtualizer algorithm	X	X	X	X	X	X
Standard Selection with single I ² C transmission	X	X	X	X	X	X
Automatic Standard Detection of terrestrial TV standards/Automatic Carrier Mute function	X	X	X	X	X	X
Automatic Sound Selection (mono/stereo/bilingual), new registers MODUS, STATUS	X	X	X	X	X	X
Two selectable sound IF (SIF) inputs	X	X	X	X	X	X
Interrupt output programmable (indicating status change)	X	X	X	X	X	X
Loudspeaker / Headphone channel with volume, balance, bass, treble, loudness	X	X	X	X	X	X
Loudspeaker channel with MDB (Micronas Dynamic Bass)	X	X	X	X	X	X
AVC: Automatic Volume Correction	X	X	X	X	X	X
Subwoofer output with programmable low-pass and complementary high-pass filter	X	X	X	X	X	X
5-band graphic equalizer for loudspeaker channel	X	X	X	X	X	X
Spatial effect for loudspeaker channel; processing of all deemphasis filtering	X	X	X	X	X	X
Four Stereo SCART (line) inputs, one Mono input; two Stereo SCART outputs	X	X	X	X	X	X
Complete SCART in/out switching matrix	X	X	X	X	X	X
Two I ² S inputs; one I ² S output	X	X	X	X	X	X
All analog FM-Stereo A2 and satellite standards	X	X			X	
All analog Mono sound carriers including AM-SECAM L	X	X	X	X	X	X
Simultaneous demodulation of (very) high-deviation FM-Mono and NICAM		X			X	
Adaptive deemphasis for satellite (Wegener-Panda, acc. to ASTRA specification)	X	X			X	X
ASTRA Digital Radio (ADR) together with DRP 3510A	X	X			X	X
All NICAM standards		X			X	
Demodulation of the BTSC multiplex signal and the SAP channel			X	X	X	
Alignment free digital DBX noise reduction for BTSC Stereo and SAP				X	X	
Alignment free digital Micronas Noise Reduction (MNR) for BTSC Stereo and SAP			X			
BTSC stereo separation (MSP 3421/41G also EIA-J) significantly better than spec.			X	X	X	
SAP and stereo detection for BTSC system			X	X	X	
Korean FM-Stereo A2 standard	X	X	X	X	X	
Alignment-free Japanese standard EIA-J			X	X	X	
Demodulation of the FM-Radio multiplex signal			X	X	X	

1.2. MSP 34x1G Version List

Version	Status	Description
MSP 3401G	available	FM Stereo (A2) Version
MSP 3411G	available	NICAM and FM Stereo (A2) Version
MSP 3421G	available	NTSC Version (A2 Korea, BTSC with Micronas Noise Reduction (MNR), Japanese EIA-J system)
MSP 3441G	not confirmed	NTSC Version (A2 Korea, BTSC with DBX noise reduction, Japanese EIA-J system)
MSP 3451G	available	Global Version (all sound standards)
MSP 3461G	not confirmed	Global Mono Version (all sound Standards)

1.3. MSP 34x1G Versions and their Application Fields

Table 1–1 provides an overview of TV sound standards that can be processed by the MSP 34x1G family. In addition, the MSP 34x1G is able to handle the FM-Radio standard. With the MSP 34x1G, a complete

multimedia receiver covering all TV sound standards together with terrestrial/cable and satellite radio sound can be built; even ASTRA Digital Radio can be processed (with a DRP 3510A coprocessor).

Table 1–1: TV Stereo Sound Standards covered by the MSP 34x1G IC Family (details see Appendix A)

MSP Version				TV-System	Position of Sound Carrier /MHz	Sound Modulation	Color System	Broadcast e.g. in:
3401				B/G	5.5/5.7421875	FM-Stereo (A2)	PAL	Germany
					5.5/5.85	FM-Mono/NICAM	PAL	Scandinavia, Spain
				L	6.5/5.85	AM-Mono/NICAM	SECAM-L	France
				I	6.0/6.552	FM-Mono/NICAM	PAL	UK, Hong Kong
3401		3411	3451	D/K	6.5/6.2578125	FM-Stereo (A2, D/K1)	SECAM-East	Slovak. Rep.
					6.5/6.7421875	FM-Stereo (A2, D/K2)	PAL	currently no broadcast
					6.5/5.7421875	FM-Stereo (A2, D/K3)	SECAM-East	Poland
					6.5/5.85	FM-Mono/NICAM (D/K, NICAM)	PAL	China, Hungary
3401		3421, 3441		Satellite	6.5 7.02/7.2 7.38/7.56 etc.	FM-Mono FM-Stereo ASTRA Digital Radio (ADR) with DRP 3510A	PAL	Europe Sat. ASTRA
				M/N	4.5/4.724212	FM-Stereo (A2)	NTSC	Korea
					4.5	FM-FM (EIA-J)	NTSC	Japan
					4.5	BTSC-Stereo + SAP	NTSC, PAL	USA, Argentina
3461				FM-Radio	10.7	FM-Stereo Radio		USA, Europe
				all Standards, but Mono demodulation only				

Fig. 1–2: Typical MSP 34x1G application

2. Functional Description

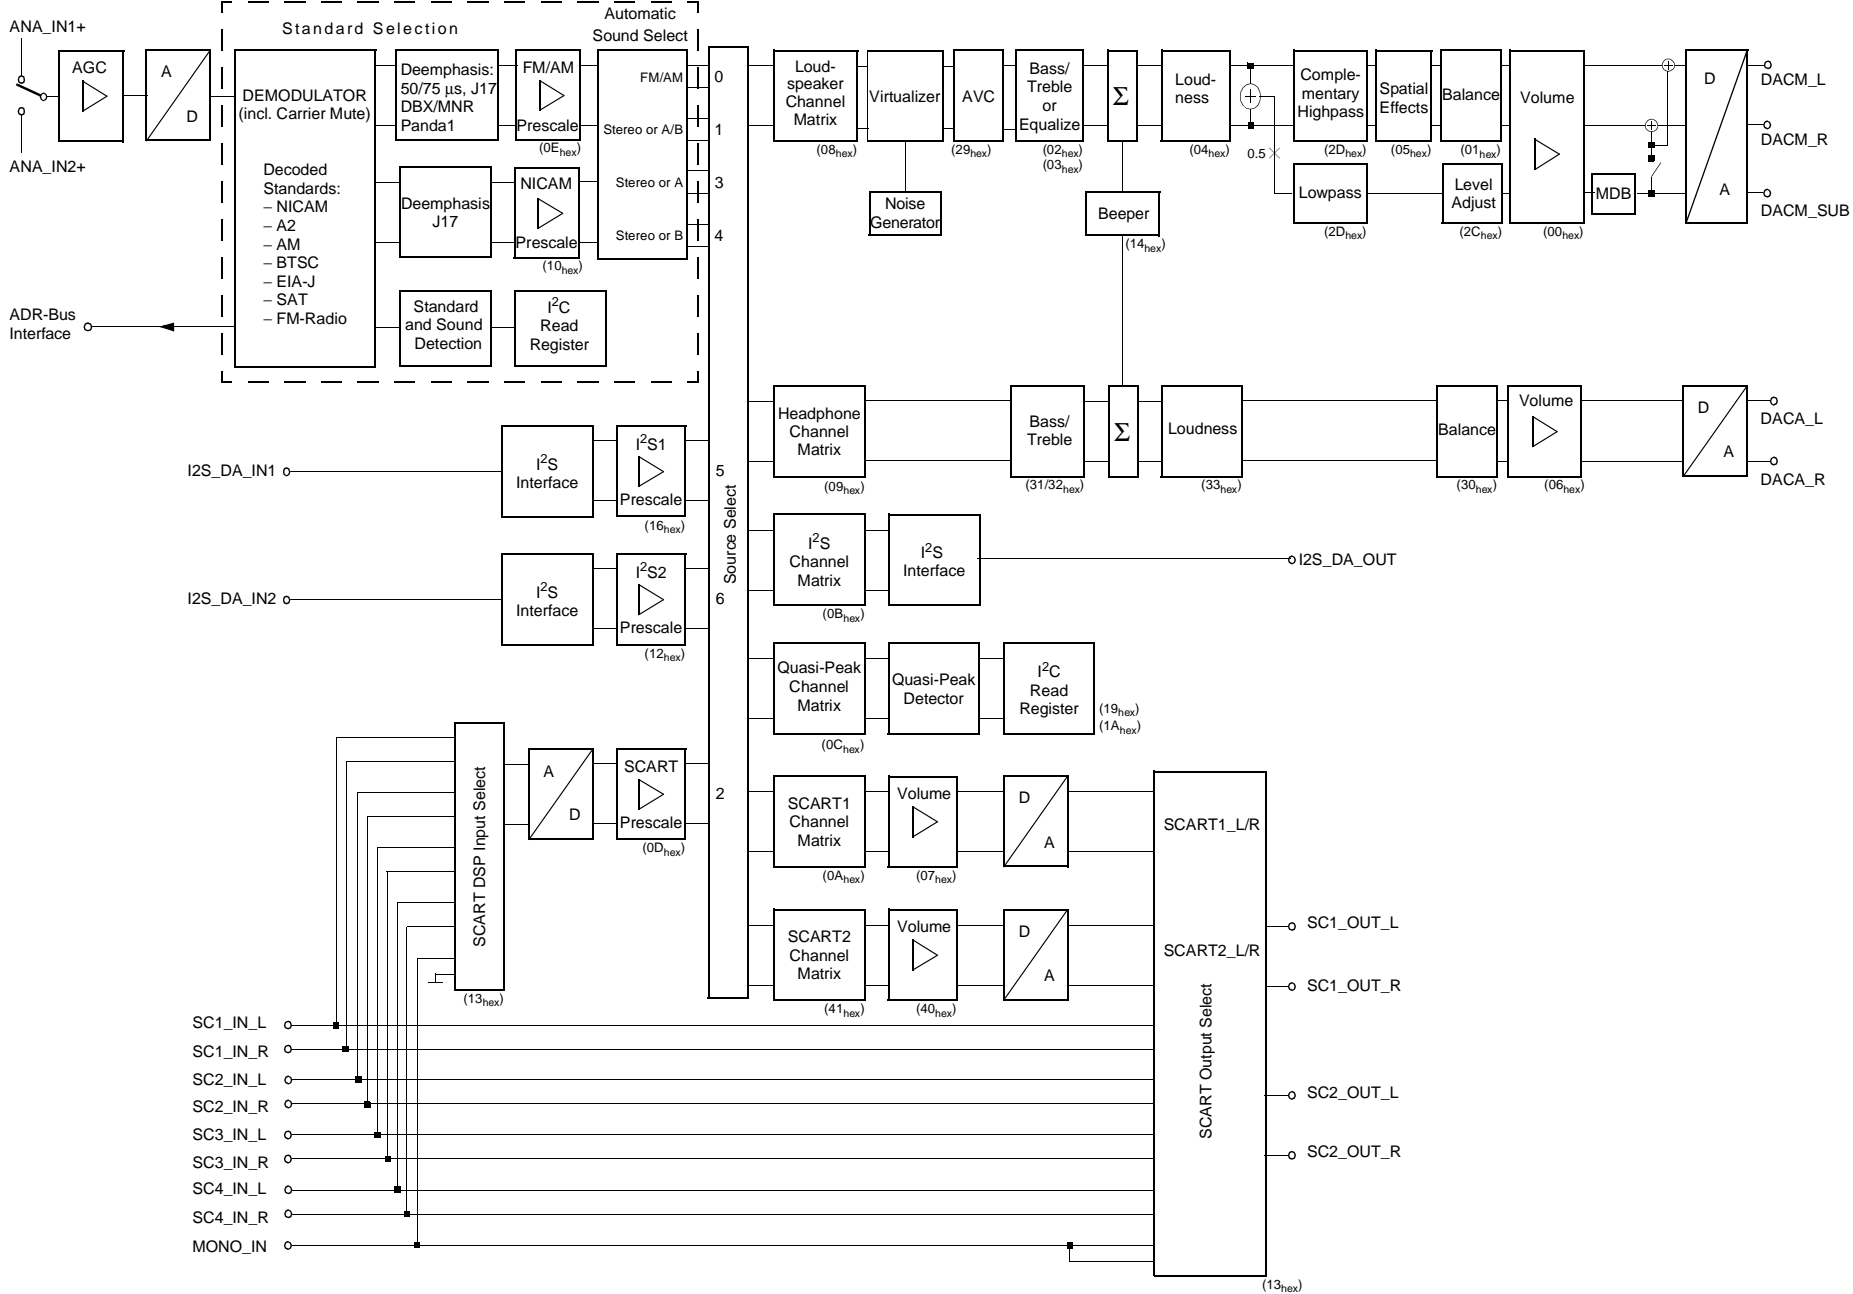

Fig. 2–1: Signal flow block diagram of the MSP 34x1G (input and output names correspond to pin names)

2.1. Architecture of the MSP 34x1G Family

Fig. 2–1 on page 9 shows a simplified block diagram of the IC. The block diagram contains all features of the MSP 3451G. Other members of the MSP 34x1G family do not have the complete set of features: The demodulator handles only a subset of the standards presented in the demodulator block; NICAM processing is only possible in the MSP 3411G and MSP 3451G.

2.2. Sound IF Processing

2.2.1. Analog Sound IF Input

The input pins ANA_IN1+, ANA_IN2+, and ANA_IN– offer the possibility to connect two different sound IF (SIF) sources to the MSP 34x1G. The analog-to-digital conversion of the preselected sound IF signal is done by an A/D-converter. An analog automatic gain circuit (AGC) allows a wide range of input levels. The high-pass filters formed by the coupling capacitors at pins ANA_IN1+ and ANA_IN2+ see Section 8. “Appendix E: Application Circuit” on page 103 are sufficient in most cases to suppress video components. Some combinations of SAW filters and sound IF mixer ICs, however, show large picture components on their outputs. In this case, further filtering is recommended.

2.2.2. Demodulator: Standards and Features

The MSP 34x1G is able to demodulate all TV-sound standards worldwide including the digital NICAM system. Depending on the MSP 34x1G version, the following demodulation modes can be performed:

A2 Systems: Detection and demodulation of two separate FM carriers (FM1 and FM2), demodulation and evaluation of the identification signal of carrier FM2.

NICAM Systems: Demodulation and decoding of the NICAM carrier, detection and demodulation of the analog (FM or AM) carrier. For D/K-NICAM, the FM carrier may have a maximum deviation of 384 kHz.

Very high deviation FM-Mono: Detection and robust demodulation of one FM carrier with a maximum deviation of 540 kHz.

BTSC-Stereo: Detection and FM demodulation of the aural carrier resulting in the MTS/MPX signal. Detection and evaluation of the pilot carrier, AM demodulation of the (L–R)-carrier and detection of the SAP subcarrier. Processing of DBX noise reduction or Micronas Noise Reduction (MNR).

BTSC-Mono + SAP: Detection and FM demodulation of the aural carrier resulting in the MTS/MPX signal. Detection and evaluation of the pilot carrier, detection and FM demodulation of the SAP subcarrier. Processing of DBX noise reduction or Micronas Noise Reduction (MNR).

Japan Stereo: Detection and FM demodulation of the aural carrier resulting in the MPX signal. Demodulation and evaluation of the identification signal and FM demodulation of the (L–R)-carrier.

FM-Satellite Sound: Demodulation of one or two FM carriers. Processing of high-deviation mono or narrow bandwidth mono, stereo, or bilingual satellite sound according to the ASTRA specification.

FM-Stereo-Radio: Detection and FM demodulation of the aural carrier resulting in the MPX signal. Detection and evaluation of the pilot carrier and AM demodulation of the (L–R)-carrier.

The demodulator blocks of all MSP 34x1G versions have identical user interfaces. Even completely different systems like the BTSC and NICAM systems are controlled the same way. Standards are selected by means of MSP Standard Codes. Automatic processes handle standard detection and identification without controller interaction. The key features of the MSP 34x1G demodulator blocks are

Standard Selection: The controlling of the demodulator is minimized: All parameters, such as tuning frequencies or filter bandwidth, are adjusted automatically by transmitting one single value to the STANDARD SELECT register. For all standards, specific MSP standard codes are defined.

Automatic Standard Detection: If the TV sound standard is unknown, the MSP 34x1G can automatically detect the actual standard, switch to that standard, and respond the actual MSP standard code.

Automatic Carrier Mute: To prevent noise effects or FM identification problems in the absence of an FM carrier, the MSP 34x1G offers a configurable carrier mute feature, which is activated automatically if the TV sound standard is selected by means of the STANDARD SELECT register. If no FM carrier is detected at one of the two MSP demodulator channels, the corresponding demodulator output is muted. This is indicated in the STATUS register.

2.2.3. Preprocessing of Demodulator Signals

The NICAM signals must be processed by a deemphasis filter and adjusted in level. The analog demodulated signals must be processed by a deemphasis filter, adjusted in level, and dematrixed. The correct deemphasis filters are already selected by setting the standard in the STANDARD SELECT register. The level adjustment has to be done by means of the FM/AM and NICAM prescale registers. The necessary dematrix function depends on the selected sound standard and the actual broadcasted sound mode (mono, stereo, or bilingual). It can be manually set by the FM Matrix Mode register or automatically by the Automatic Sound Selection.

2.2.4. Automatic Sound Select

In the Automatic Sound Select mode, the dematrix function is automatically selected based on the identification information in the STATUS register. No I²C interaction is necessary when the broadcasted sound mode changes (e.g. from mono to stereo).

The demodulator supports the identification check by switching between mono-compatible standards (standards that have the same FM-Mono carrier) automatically and non-audible. If B/G-FM or B/G-NICAM is selected, the MSP will switch between these standards. The same action is performed for the standards: D/K1-FM, D/K2-FM, D/K3-FM and D/K-NICAM. Switching is only done in the absence of any stereo or bilingual identification. If identification is found, the MSP keeps the detected standard.

In case of high bit-error rates, the MSP 34x1G automatically falls back from digital NICAM sound to analog FM or AM mono.

Table 2–1 summarizes all actions that take place when Automatic Sound Select is switched on.

To provide more flexibility, the Automatic Sound Select block prepares four different source channels of demodulated sound (Fig. 2–2). By choosing one of the four demodulator channels, the preferred sound mode can be selected for each of the output channels (loudspeaker, headphone, etc.). This is done by means of the Source Select registers.

The following source channels of demodulated sound are defined:

- **“FM/AM” channel:** Analog mono sound, stereo if available. In case of NICAM, analog mono only (FM or AM mono).
- **“Stereo or A/B” channel:** Analog or digital mono sound, stereo if available. In case of bilingual broadcast, it contains both languages A (left) and B (right).

- **“Stereo or A” channel:** Analog or digital mono sound, stereo if available. In case of bilingual broadcast, it contains language A (on left and right).
- **“Stereo or B” channel:** Analog or digital mono sound, stereo if available. In case of bilingual broadcast, it contains language B (on left and right).

Fig. 2–2 and Table 2–2 show the source channel assignment of the demodulated signals in case of Automatic Sound Select mode for all sound standards.

Note: The analog primary input channel contains the signal of the mono FM/AM carrier or the L+R signal of the MPX carrier. The secondary input channel contains the signal of the 2nd FM carrier, the L-R signal of the MPX carrier, or the SAP signal.

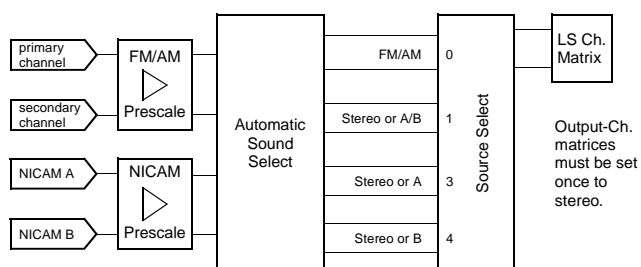

Fig. 2–2: Source channel assignment of demodulated signals in Automatic Sound Select Mode

2.2.5. Manual Mode

Fig. 2–3 shows the source channel assignment of demodulated signals in case of manual mode. If manual mode is required, more information can be found in Section 6.7. “Demodulator Source Channels in Manual Mode” on page 99.

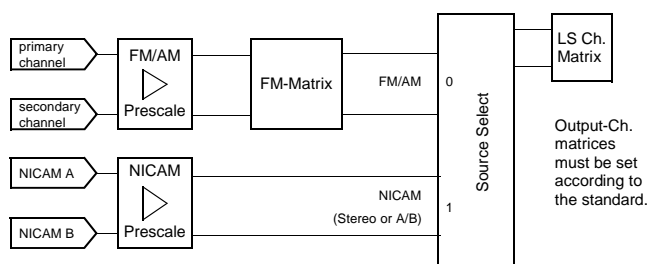

Fig. 2–3: Source channel assignment of demodulated signals in Manual Mode

2.3. Preprocessing for SCART and I²S Input Signals

The SCART and I²S inputs need only be adjusted in level by means of the SCART and I²S prescale registers.

Table 2–1: Performed actions of the Automatic Sound Selection

Selected TV Sound Standard	Performed Actions
B/G-FM, D/K-FM, M-Korea, and M-Japan	Evaluation of the identification signal and automatic switching to mono, stereo, or bilingual. Preparing four demodulator source channels according to Table 2–2.
B/G-NICAM, L-NICAM, I-NICAM, and D/K-NICAM	<p>Evaluation of NICAM-C-bits and automatic switching to mono, stereo, or bilingual. Preparing four demodulator source channels according to Table 2–2.</p> <p>In case of bad or no NICAM reception, the MSP switches automatically to FM/AM mono and switches back to NICAM if possible. A hysteresis prevents periodical switching.</p>
B/G-FM, B/G-NICAM or D/K1-FM, D/K2-FM, D/K3-FM, and D/K-NICAM	<p>Automatic searching for stereo/bilingual-identification in case of mono transmission. Automatic and non-audible changes between Dual-FM and FM-NICAM standards while listening to the basic FM-Mono sound carrier.</p> <p>Example: If starting with B/G-FM-Stereo, there will be a periodical alternation to B/G-NICAM in the absence of FM-Stereo/Bilingual or NICAM-identification. Once an identification is detected, the MSP keeps the corresponding standard.</p>
BTSC-STEREO, FM Radio	Evaluation of the pilot signal and automatic switching to mono or stereo. Preparing four demodulator source channels according to Table 2–2. Detection of the SAP carrier.
BTSC-SAP	In the absence of SAP, the MSP switches to BTSC-Stereo if available. If SAP is detected, the MSP switches automatically to SAP (see Table 2–2).

Table 2–2: Sound modes for the demodulator source channels with Automatic Sound Select

			Source Channels in Automatic Sound Select Mode			
Broadcasted Sound Standard	Selected MSP Standard Code ³⁾	Broadcasted Sound Mode	FM/AM (source select: 0)	Stereo or A/B (source select: 1)	Stereo or A (source select: 3)	Stereo or B (source select: 4)
M-Korea B/G-FM D/K-FM M-Japan	02 03, 08 ¹⁾ 04, 05, 07, 0B ¹⁾ 30	MONO	Mono	Mono	Mono	Mono
		STEREO	Stereo	Stereo	Stereo	Stereo
		BILINGUAL: Languages A and B	Left = A Right = B	Left = A Right = B	A	B
B/G-NICAM L-NICAM I-NICAM D/K-NICAM D/K-NICAM (with high deviation FM)	08, 03 ²⁾ 09 0A 0B, 04 ²⁾ , 05 ²⁾ 0C, 0D	NICAM not available or error rate too high	analog Mono	analog Mono	analog Mono	analog Mono
		MONO	analog Mono	NICAM Mono	NICAM Mono	NICAM Mono
		STEREO	analog Mono	NICAM Stereo	NICAM Stereo	NICAM Stereo
		BILINGUAL: Languages A and B	analog Mono	Left = NICAM A Right = NICAM B	NICAM A	NICAM B
BTSC	20, 21	MONO	Mono	Mono	Mono	Mono
		STEREO	Stereo	Stereo	Stereo	Stereo
	20	MONO+SAP	Mono	Mono	Mono	Mono
		STEREO+SAP	Stereo	Stereo	Stereo	Stereo
	21	MONO+SAP	Left = Mono Right = SAP	Left = Mono Right = SAP	Mono	SAP
		STEREO+SAP	Left = Mono Right = SAP	Left = Mono Right = SAP	Mono	SAP
FM Radio	40	MONO	Mono	Mono	Mono	Mono
		STEREO	Stereo	Stereo	Stereo	Stereo

¹⁾ The Automatic Sound Select process will automatically switch to the mono compatible analog standard.

²⁾ The Automatic Sound Select process will automatically switch to the mono compatible digital standard.

³⁾ The MSP Standard Codes are defined in Table 3–7 on page 23.

2.4. Source Selection and Output Channel Matrix

The Source Selector makes it possible to distribute all source signals (one of the demodulator source channels, SCART, or I²S input) to the desired output channels (loudspeaker, headphone, etc.). All input and output signals can be processed simultaneously. Each source channel is identified by a unique source address.

For each output channel, the sound mode can be set to sound A, sound B, stereo, or mono by means of the output channel matrix.

If Automatic Sound Select is on, the output channel matrix can stay fixed to stereo (transparent) for demodulated signals.

2.5. Audio Baseband Processing

2.5.1. Automatic Volume Correction (AVC)

Different sound sources (e.g. terrestrial channels, SAT channels, or SCART) fairly often do not have the same volume level. Advertisements during movies usually have a higher volume level than the movie itself. This results in annoying volume changes. The AVC solves this problem by equalizing the volume level.

To prevent clipping, the AVC's gain decreases quickly in dynamic boost conditions. To suppress oscillation effects, the gain increases rather slowly for low level inputs. The decay time is programmable by means of the AVC register (see page 33).

For input signals ranging from -24 dBr to 0 dBr, the AVC maintains a fixed output level of -18 dBr. Fig. 2-4 shows the AVC output level versus its input level. For prescale and volume registers set to 0 dB, a level of 0 dBr corresponds to full scale input/output. This is

- SCART input/output 0 dBr = 2.0 V_{rms}
- Loudspeaker output 0 dBr = 1.4 V_{rms}

Fig. 2-4: Simplified AVC characteristics

2.5.2. Loudspeaker and Headphone Outputs

The following baseband features are implemented in the loudspeaker and headphone output channels: bass/treble, loudness, balance, and volume. A square wave beeper can be added to the loudspeaker and headphone channel. The loudspeaker channel additionally performs: equalizer (not simultaneously with bass/treble), spatial effects, and a subwoofer cross-over filter.

2.5.3. Subwoofer Output

The subwoofer signal is created by combining the left and right channels directly behind the loudness block using the formula $(L+R)/2$. Due to the division by 2, the D/A converter will not be overloaded, even with full scale input signals. The subwoofer signal is filtered by a third-order low-pass with programmable corner frequency followed by a level adjustment. At the loudspeaker channels, a complementary high-pass filter can be switched on. Subwoofer and loudspeaker output use the same volume (Loudspeaker Volume Register).

2.5.4. Quasi-Peak Detector

The quasi-peak readout register can be used to read out the quasi-peak level of any input source. The feature is based on following filter time constants:

- attack time: 1.3 ms
- decay time: 37 ms

2.5.5. Micronas Dynamic Bass (MDB)

The **Micronas Dynamic Bass** system (MDB) extends the frequency range of loudspeakers or headphones.

After the adaption of MDB to the loudspeakers and the cabinet, further customizing of MDB allows individual fine tuning of the sound.

The MDB is placed in the subwoofer path. For applications without a subwoofer, the enhanced bass signal can be added back onto the Left/Right channels (see Fig. 2–1 on page 9). Micronas Dynamic Bass combines two effects: dynamic amplification and adding harmonics.

2.5.5.1. Dynamic Amplification

Low frequency signals can be boosted while the output signal amplitude is measured. If the amplitude comes close to a definable limit, the gain is reduced automatically in dynamic Volume mode. Therefore, the system adapts to the signal amplitude which is really present at the output of the MSP device. Clipping effects are avoided.

Fig. 2–5: Dynamic amplification

2.5.5.2. Adding Harmonics

MDB exploits the psychoacoustic phenomenon of the ‘missing fundamental’. Adding harmonics of the frequency components below the cutoff frequency gives the impression of actually hearing the low frequency fundamental. In other words: The listener has the impression that a loudspeaker system seems to reproduce frequencies although physically not possible.

Fig. 2–6: Adding harmonics

2.5.5.3. MDB Parameters

Several parameters allow tuning the characteristics of MDB according to the TV loudspeaker, the cabinet, and personal preferences (see Table 3–11). For more detailed information on how to set up MDB, please refer to the corresponding application note on the Micronas homepage.

2.6. Virtual Surround System Application Tips

2.6.1. Sweet Spot

Good results are only obtained in a rather close area along the middle axis between the two loudspeakers: the sweet spot. Moving away from this position degrades the effect.

2.6.2. Clipping

For the test at Dolby Labs, it is very important to have no clipping effects even with worst case signals. That is, 2 V_{RMS} input signal may not clip. The SCART Input Prescale register has to be set to values of 19_{hex} (25_{dec}) or lower (see SCART Input Prescale on page 30).

Test signals: sine sweep with 2 V_{RMS}; L only, R only, L&R equal phase, L&R anti phase.

Listening tests: Dolby Trailers (train trailer, city trailer, canyon trailer...)

2.6.3. Loudspeaker Requirements

The loudspeakers used and their positioning inside the TV set will greatly influence the performance of the virtualizer. The algorithm works with the direct sound path. Reflected sound waves reduce the effect. So it's most important to have as much direct sound as possible, compared to indirect sound.

To obtain the approval for a TV set, Dolby Laboratories require mounting the loudspeakers in front of the set. Loudspeakers radiating to the side of the TV set will not produce convincing effects. Good directionality of the loudspeakers towards the listener is optimal.

The virtualizer was specially developed for implementation in TV sets. Even for rather small stereo TV's, sufficient sound effects can be obtained. For small sets, the loudspeaker placement should be to the side of the CRT; for large screen sets (or 16:9 sets), mounting the loudspeakers below the CRT is acceptable (large separation is preferred, low frequency speakers should be outmost to avoid cancellation effects). Using external loudspeakers with a large stereo base will not create optimal effects.

The loudspeakers should be able to reproduce a wide frequency range. The most important frequency range starts from 160 Hz and ranges up to 5 kHz.

Great care has to be taken with systems that use one common subwoofer: A single loudspeaker cannot reproduce virtual sound locations. The crossover frequency must be lower than 120 Hz.

2.6.4. Cabinet Requirements

During listening tests at Dolby Laboratories, **no resonances** in the cabinet should occur.

Good material to check for resonances are the Dolby Trailers or other dynamic sound tracks.

2.7. SCART Signal Routing

2.7.1. SCART DSP In and SCART Out Select

The SCART DSP Input Select and SCART Output Select blocks include full matrix switching facilities. To design a TV set with four pairs of SCART-inputs and two pairs of SCART-outputs, no external switching hardware is required. The switches are controlled by the ACB user register (see page 41).

2.7.2. Stand-by Mode

If the MSP 34x1G is switched off by first pulling STANDBYQ low and then (after $>1\ \mu\text{s}$ delay) switching off DVSUP and AVSUP, but keeping AHVSUP ('**Stand-by'-mode**), the SCART switches maintain their position and function. This allows the copying from SCART-input to SCART-output in the TV set's stand-by mode.

In case of power on or starting from stand-by (switching on the DVSUP and AVSUP, RESETQ going high 2 ms later), all internal registers except the ACB register (page 41) are reset to the default configuration (see Table 3–5 on page 20). The reset position of the ACB register becomes active after the first I²C transmission into the Baseband Processing part. By transmitting the ACB register first, the reset state can be redefined.

2.8. I²S Bus Interface

The MSP 34x1G has a synchronous master/slave input/output interface running on 32 kHz.

The interface accepts two formats:

1. I²S_WS changes at the word boundary
2. I²S_WS changes one I²S-clock period before the word boundaries.

All I²S options are set by means of the MODUS and the I2S_CONFIGURATION registers.

The I²S bus interface consists of five pins:

- I2S_DA_IN1, I2S_DA_IN2:
I²S serial data input: 16, 18...32 bits per sample
- I2S_DA_OUT:
I²S serial data output: 16, 18...32 bits per sample
- I2S_CL:
I²S serial clock
- I2S_WS:
I²S word strobe signal defines the left and right sample

If the MSP 34x1G serves as the master on the I²S interface, the clock and word strobe lines are driven by the IC. In this mode, only 16 or 32 bits per sample can be selected. In slave mode, these lines are input to the IC and the MSP clock is synchronized to 576 times the I2S_WS rate (32 kHz). NICAM operation is not possible in slave mode.

An I²S timing diagram is shown in Fig. 4–28 on page 71.

2.9. ADR Bus Interface

For the ASTRA Digital Radio System (ADR), the MSP 3401G, MSP 3411G, and MSP 3451G performs preprocessing such as carrier selection and filtering. Via the 3-line ADR-bus, the resulting signals are transferred to the DRP 3510A coprocessor, where the source decoding is performed. To be prepared for an upgrade to ADR with an additional DRP board, the following lines of MSP 34x1G should be provided on a feature connector:

- AUD_CL_OUT
- I2S_DA_IN1 or I2S_DA_IN2
- I2S_DA_OUT
- I2S_WS
- I2S_CL
- ADR_CL, ADR_WS, ADR_DA

For more details, please refer to the DRP 3510A data sheet.

2.10. Digital Control I/O Pins and Status Change Indication

The static level of the digital input/output pins D_CTR_I/O_0/1 is switchable between HIGH and LOW via the I²C-bus by means of the ACB register (see page 41). This enables the controlling of external hardware switches or other devices via I²C-bus.

The digital input/output pins can be set to high impedance by means of the MODUS register (see page 26). In this mode, the pins can be used as input. The current state can be read out of the STATUS register (see page 28).

Optionally, the pin D_CTR_I/O_1 can be used as an interrupt request signal to the controller, indicating any changes in the read register STATUS. This makes polling unnecessary, I²C bus interactions are reduced to a minimum (see STATUS register on page 28 and MODUS register on page 26).

2.11. Clock PLL Oscillator and Crystal Specifications

The MSP 34x1G derives all internal system clocks from the 18.432-MHz oscillator. In NICAM or in I²S-Slave mode, the clock is phase-locked to the corresponding source. Therefore, it is not possible to use NICAM and I²S-Slave mode at the same time.

For proper performance, the MSP clock oscillator requires a 18.432-MHz crystal. Note that for the phase-locked modes (NICAM, I²S-Slave), crystals with tighter tolerance are required.

3. Control Interface

3.1. I²C Bus Interface

The MSP 34x1G is controlled via the I²C bus slave interface.

The IC is selected by transmitting one of the MSP 34x1G device addresses. In order to allow up to three MSP ICs to be connected to a single bus, an address select pin (ADR_SEL) has been implemented. With ADR_SEL pulled to high, low, or left open, the MSP 34x1G responds to different device addresses. A device address pair is defined as a write address and a read address (see Table 3–1).

Writing is done by sending the write device address, followed by the subaddress byte, two address bytes, and two data bytes.

Reading is done by sending the write device address, followed by the subaddress byte and two address bytes. Without sending a stop condition, reading of the addressed data is completed by sending the device read address and reading two bytes of data.

Refer to Section 3.1.3. for the I²C bus protocol and to Section 3.4. “Programming Tips” on page 45 for proposals of MSP 34x1G I²C telegrams. See Table 3–2 for a list of available subaddresses.

Besides the possibility of hardware reset, the MSP can also be reset by means of the RESET bit in the CONTROL register by the controller via I²C bus.

Due to the architecture of the MSP 34x1G, the IC cannot react immediately to an I²C request. The typical

response time is about 0.3 ms. If the MSP cannot accept another byte of data (e.g. while servicing an internal interrupt), it holds the clock line I2C_CL low to force the transmitter into a wait state. The I²C Bus Master must read back the clock line to detect when the MSP is ready to receive the next I²C transmission. The positions within a transmission where this may happen are indicated by 'Wait' in Section 3.1.3. The maximum wait period of the MSP during normal operation mode is less than 1 ms.

3.1.1. Internal Hardware Error Handling

In case of any hardware problems (e.g. interruption of the power supply of the MSP), the MSP's wait period is extended to 1.8 ms. After this time period elapses, the MSP releases data and clock lines.

Indication and solving the error status:

To indicate the error status, the remaining acknowledge bits of the actual I²C-protocol will be left high. Additionally, bit[14] of CONTROL is set to one. The MSP can then be reset via the I²C bus by transmitting the RESET condition to CONTROL.

Indication of reset:

Any reset, even caused by an unstable reset line etc., is indicated in bit[15] of CONTROL.

A general timing diagram of the I²C bus is shown in Fig. 4–27 on page 69.

Table 3–1: I²C Bus Device Addresses

ADR_SEL	Low (connected to DVSS)		High (connected to DVSUP)		Left Open	
Mode	Write	Read	Write	Read	Write	Read
MSP device address	80 _{hex}	81 _{hex}	84 _{hex}	85 _{hex}	88 _{hex}	89 _{hex}

Table 3–2: I²C Bus Subaddresses

Name	Binary Value	Hex Value	Mode	Function
CONTROL	0000 0000	00	Read/Write	Write: Software reset of MSP (see Table 3–3) Read: Hardware error status of MSP
WR_DEM	0001 0000	10	Write	write address demodulator
RD_DEM	0001 0001	11	Write	read address demodulator
WR_DSP	0001 0010	12	Write	write address DSP
RD_DSP	0001 0011	13	Write	read address DSP

3.1.2. Description of CONTROL Register

Table 3–3: CONTROL as a Write Register

Name	Subaddress	Bit[15] (MSB)	Bits[14:0]
CONTROL	00 _{hex}	1 : RESET 0 : normal	0

Table 3–4: CONTROL as a Read Register

Name	Subaddress	Bit[15] (MSB)	Bit[14]	Bits[13:0]
CONTROL	00 _{hex}	RESET status after last reading of CONTROL: 0 : no reset occurred 1 : reset occurred	Internal hardware status: 0 : no error occurred 1 : internal error occurred	not of interest
Reading of CONTROL will reset the bits[15,14] of CONTROL. After Power-on, bit[15] of CONTROL will be set; it must be read once to be reset.				

3.1.3. Protocol Description

Write to DSP or Demodulator

S	write device address	Wait	ACK	sub-addr	ACK	addr-byte high	ACK	addr-byte low	ACK	data-byte high	ACK	data-byte low	ACK	P
---	----------------------	------	-----	----------	-----	----------------	-----	---------------	-----	----------------	-----	---------------	-----	---

Read from DSP or Demodulator

S	write device address	Wait	ACK	sub-addr	ACK	addr-byte high	ACK	addr-byte low	ACK	S	read device address	Wait	ACK	data-byte high	ACK	data-byte low	NAK	P
---	----------------------	------	-----	----------	-----	----------------	-----	---------------	-----	---	---------------------	------	-----	----------------	-----	---------------	-----	---

Write to Control Register

S	write device address	Wait	ACK	sub-addr	ACK	data-byte high	ACK	data-byte low	ACK	P
---	----------------------	------	-----	----------	-----	----------------	-----	---------------	-----	---

Read from Control Register

S	write device address	Wait	ACK	00hex	ACK	S	read device address	Wait	ACK	data-byte high	ACK	data-byte low	NAK	P
---	----------------------	------	-----	-------	-----	---	---------------------	------	-----	----------------	-----	---------------	-----	---

Note: S = I²C-Bus Start Condition from master

P = I²C-Bus Stop Condition from master

ACK = Acknowledge-Bit: LOW on I2C_DA from slave (= MSP, light gray) or master (= controller, dark gray)

NAK = Not Acknowledge-Bit: HIGH on I2C_DA from master (dark gray) to indicate 'End of Read' or from MSP indicating internal error state

Wait = I²C-Clock line is held low, while the MSP is processing the I²C command.
This waiting time is max. 1 ms

Fig. 3–1: I²C bus protocol (MSB first; data must be stable while clock is high)

3.1.4. Proposals for General MSP 34x1G I²C Telegrams

3.1.4.1. Symbols

daw	write device address (80 _{hex} , 84 _{hex} or 88 _{hex})
dar	read device address (81 _{hex} , 85 _{hex} or 89 _{hex})
<	Start Condition
>	Stop Condition
aa	Address Byte
dd	Data Byte

3.1.4.2. Write Telegrams

<daw 00 d0 00>	write to CONTROL register
<daw 10 aa aa dd dd>	write data into demodulator
<daw 12 aa aa dd dd>	write data into DSP

3.1.4.3. Read Telegrams

<daw 00 <dar dd dd>	read data from CONTROL register
<daw 11 aa aa <dar dd dd>	read data from demodulator
<daw 13 aa aa <dar dd dd>	read data from DSP

3.1.4.4. Examples

<80 00 80 00>	RESET MSP statically
<80 00 00 00>	Clear RESET
<80 10 00 20 00 03>	Set demodulator to stand. 03 _{hex}
<80 11 02 00 <81 dd dd>	Read STATUS
<80 12 00 08 01 20>	Set loudspeaker channel source to NICAM and Matrix to STEREO

More examples of typical application protocols are listed in Section 3.4. “Programming Tips” on page 45.

3.2. Start-Up Sequence: Power-Up and I²C-Controlling

After POWER-ON or RESET (see Fig. 4–26), the IC is in an inactive state. All registers are in the Reset position (see Table 3–5 and Table 3–6), the analog outputs are muted. The controller has to initialize all registers for which a non-default setting is necessary.

3.3. MSP 34x1G Programming Interface

3.3.1. User Registers Overview

The MSP 34x1G is controlled by means of user registers. The complete list of all user registers is given in Table 3–5 and Table 3–6. The registers are partitioned into the Demodulator section (subaddress 10_{hex} for writing, 11_{hex} for reading) and the Baseband Processing sections (subaddress 12_{hex} for writing, 13_{hex} for reading).

Write and read registers are 16 bit wide, whereby the MSB is denoted bit[15]. Transmissions via I²C bus have to take place in 16-bit words (two byte transfers, with the most significant byte transferred first). All write registers, except the demodulator write registers are readable.

Unused parts of the 16-bit write registers must be zero.
Addresses not given in this table must not be accessed.

For reasons of software compatibility to the MSP 34xD, a Manual/Compatibility Mode is available. More read and write registers together with a detailed description can be found in “Appendix B: Manual/Compatibility Mode” on page 85.

Table 3–5: List of MSP 34x1G Write Registers

Write Register	Address (hex)	Bits	Description and Adjustable Range	Reset	See Page
I²C Subaddress = 10_{hex} ; Registers are <i>not</i> readable					
STANDARD SELECT	00 20	[15:0]	Initial Programming of the Demodulator	00 00	24
MODUS	00 30	[15:0]	Demodulator, Automatic and I ² S options	00 00	26
I ² S CONFIGURATION	00 40	[15:0]	Configuration of I ² S options	00 00	27
I²C Subaddress = 12_{hex} ; Registers are <i>all</i> readable by using I²C Subaddress = 13_{hex}					
Volume loudspeaker channel	00 00	[15:8]	[+12 dB ... –114 dB, MUTE]	MUTE	32
Volume / Mode loudspeaker channel		[7:0]	1/8 dB Steps, Reduce Volume / Tone Control / Compromise / Dynamic	00 _{hex}	
Balance loudspeaker channel [L/R]	00 01	[15:8]	[0...100 / 100% and 100 / 0...100%] [–127...0 / 0 and 0 / –127...0 dB]	100%/100%	33
Balance mode loudspeaker		[7:0]	[Linear / logarithmic mode]	linear mode	
Bass loudspeaker channel	00 02	[15:8]	[+20 dB ... –12 dB]	0 dB	34
Treble loudspeaker channel	00 03	[15:8]	[+15 dB ... –12 dB]	0 dB	35
Loudness loudspeaker channel	00 04	[15:8]	[0 dB ... +17 dB]	0 dB	36
Loudness filter characteristic		[7:0]	[NORMAL, SUPER_BASS]	NORMAL	
Spatial effect strength loudspeaker ch.	00 05	[15:8]	[–100%...OFF...+100%]	OFF	37
Spatial effect mode/customize		[7:0]	[SBE, SBE+PSE]	SBE+PSE	
Volume headphone channel	00 06	[15:8]	[+12 dB ... –114 dB, MUTE]	MUTE	32
Volume / Mode headphone channel		[7:0]	1/8 dB Steps, Reduce Volume / Tone Control	00 _{hex}	
Volume SCART1 output channel	00 07	[15:8]	[+12 dB ... –114 dB, MUTE]	MUTE	40
Loudspeaker source select	00 08	[15:8]	[FM/AM, NICAM, SCART, I ² S1, I ² S2]	FM/AM	31
Loudspeaker channel matrix		[7:0]	[SOUNDA, SOUNDB, STEREO, MONO...]	SOUNDA	31
Headphone source select	00 09	[15:8]	[FM/AM, NICAM, SCART, I ² S1, I ² S2]	FM/AM	31

3.3.2. Description of User Registers

Table 3–7: Standard Codes for STANDARD SELECT register

MSP Standard Code (Data in hex)	TV Sound Standard	Sound Carrier Frequencies in MHz	MSP 34x1G Version
Automatic Standard Detection			
00 01	Starts Automatic Standard Detection and sets detected standard		all
Standard Selection			
00 02	M-Dual FM-Stereo	4.5/4.724212	3401, -11, -21, -41, -51
00 03	B/G -Dual FM-Stereo ¹⁾	5.5/5.7421875	3401, -11, -51
00 04	D/K1-Dual FM-Stereo ²⁾	6.5/6.2578125	
00 05	D/K2-Dual FM-Stereo ²⁾	6.5/6.7421875	
00 06	D/K -FM-Mono with HDEV3 ³⁾ , not detectable by Automatic Standard Detection, HDEV3 ³⁾ SAT-Mono (i.e. Eutelsat, s. Table 6–18)	6.5	
00 07	D/K3-Dual FM-Stereo	6.5/5.7421875	
00 08	B/G -NICAM-FM ¹⁾	5.5/5.85	3411, -51
00 09	L -NICAM-AM	6.5/5.85	
00 0A	I -NICAM-FM	6.0/6.552	
00 0B	D/K -NICAM-FM ²⁾	6.5/5.85	
00 0C	D/K -NICAM-FM with HDEV2 ⁴⁾ , not detectable by Automatic Standard Detection, for China	6.5/5.85	
00 0D	D/K -NICAM-FM with HDEV3 ³⁾ , not detectable by Automatic Standard Detection, for China	6.5/5.85	
00 20	BTSC-Stereo	4.5	3421, -41, -51
00 21	BTSC-Mono + SAP		
00 30	M-EIA-J Japan Stereo	4.5	3421, -41, -51
00 40	FM-Stereo Radio with 75 μs Deemphasis	10.7	3421, -41, -51
00 50	SAT-Mono (s. Table 6–18)	6.5	3401, -11, -51
00 51	SAT-Stereo (s. Table 6–18)	7.02/7.20	
00 60	SAT ADR (Astra Digital Radio)	6.12	
<div>1) In case of Automatic Sound Select, the B/G-codes 3_{hex} and 8_{hex} are equivalent.</div> <div>2) In case of Automatic Sound Select, the D/K-codes 4_{hex}, 5_{hex}, 7_{hex} and B_{hex} are equivalent.</div> <div>3) HDEV3: Max. FM deviation must not exceed 540 kHz</div> <div>4) HDEV2: Max. FM deviation must not exceed 360 kHz</div>			

3.3.2.1. STANDARD SELECT Register

The TV sound standard of the MSP 34x1G demodulator is determined by the STANDARD SELECT register. There are two ways to use the STANDARD SELECT register:

- Setting up the demodulator for a TV sound standard by sending the corresponding standard code with a single I²C bus transmission.
- Starting the Automatic Standard Detection for terrestrial TV standards. This is the most comfortable way to set up the demodulator. Within 0.5 s, the detection and setup of the actual TV sound standard is performed. The detected standard can be read out of the STANDARD RESULT register by the control processor. This feature is recommended for the primary setup of a TV set. Outputs should be muted during Automatic Standard Detection.

The Standard Codes are listed in Table 3–7.

Selecting a TV sound standard via the STANDARD SELECT register initializes the demodulator. This includes: AGC-settings and carrier mute, tuning frequencies, FIR-filter settings, demodulation mode (FM, AM, NICAM), deemphasis and identification mode.

TV stereo sound standards that are unavailable for a specific MSP version are processed in analog mono sound of the standard. In that case, stereo or bilingual processing will not be possible.

For a complete setup of the TV sound processing from analog IF input to the source selection, the transmissions as shown in Section 3.5. are necessary.

For reasons of software compatibility to the MSP 34xxD, a Manual/Compatibility mode is available. A detailed description of this mode can be found on page 85.

3.3.2.2. Refresh of STANDARD SELECT Register

A general refresh of the STANDARD SELECT register is not allowed. However, the following method enables watching the MSP 34x1G “alive” status and detection of accidental resets (only versions B6 and later):

- After Power-on, bit[15] of CONTROL will be set; it must be read once to enable the reset-detection feature.
- Reading of the CONTROL register and checking the reset indicator bit[15].
- If bit[15] is “0”, any refresh of the STANDARD SELECT register **is not allowed**.
- If bit[15] is “1”, indicating a reset, a refresh of the STANDARD SELECT register and all other MSPG registers is required.

3.3.2.3. STANDARD RESULT Register

If Automatic Standard Detection is selected in the STANDARD SELECT register, status and result of the Automatic Standard Detection process can be read out of the STANDARD RESULT register. The possible results are based on the mentioned Standard Code and are listed in Table 3–8.

In cases where no sound standard has been detected (no standard present, too much noise, strong interferers, etc.) the STANDARD RESULT register contains 00 00_{hex}. In that case, the controller has to start further actions (for example set the standard according to a preference list or by manual input).

As long as the STANDARD RESULT register contains a value greater than 07 FF_{hex}, the Automatic Standard Detection is still active. During this period, the MODUS and STANDARD SELECT register must not be written. The STATUS register will be updated when the Automatic Standard Detection has finished.

If a present sound standard is unavailable for a specific MSP-version, it detects and switches to the analog mono sound of this standard.

Example:

The MSPs 3421G and 3441G will detect a B/G-NICAM signal as standard 3 and will switch to the analog FM-Mono sound.

Table 3–8: Results of the Automatic Standard Detection

Broadcasted Sound Standard	STANDARD RESULT Register Read 007E _{hex}
Automatic Standard Detection could not find a sound standard	0000 _{hex}
B/G-FM	0003 _{hex}
B/G-NICAM	0008 _{hex}
I	000A _{hex}
FM-Radio	0040 _{hex}
M-Korea M-Japan M-BTSC	0002 _{hex} (if MODUS[14,13]=00)
	0020 _{hex} (if MODUS[14,13]=01)
	0030 _{hex} (if MODUS[14,13]=10)
L-AM D/K1 D/K2 D/K3	0009 _{hex} (if MODUS[12]=0)
	0004 _{hex} (if MODUS[12]=1)
L-NICAM D/K-NICAM	0009 _{hex} (if MODUS[12]=0)
	000B _{hex} (if MODUS[12]=1)
Automatic Standard Detection still active	>07FF _{hex}

3.3.2.4. Write Registers on I²C Subaddress 10_{hex}Table 3–9: Write Registers on I²C Subaddress 10_{hex}

Register Address	Function	Name

(Mode A)</p> <p>2_{hex} Stereo Basewidth Enlargement (SBE) only. (Mode B)</p> <p>bit[3:0] Spatial Effect High-Pass Gain</p> <p>0_{hex} max. high-pass gain</p> <p>2_{hex} 2/3 high-pass gain</p> <p>4_{hex} 1/3 high-pass gain</p> <p>6_{hex} min. high-pass gain</p> <p>8_{hex} automatic</p> <p>Spatial effects should not be used together with 3D-PANORAMA or PANORAMA.</p> <p>There are several spatial effect modes available:</p> <p>In mode A (low byte = 00_{hex}), the spatial effect depends on the source mode. If the incoming signal is mono, Pseudo Stereo Effect is active; for stereo signals, Pseudo Stereo Effect and Stereo Basewidth Enlargement is effective. The strength of the effect is controllable by the upper byte. A negative value reduces the stereo image. A strong spatial effect is recommended for small TV sets where loudspeaker spacing is rather close. For large screen TV sets, a more moderate spatial effect is recommended.</p> <p>In mode B, only Stereo Basewidth Enlargement is effective. For mono input signals, the Pseudo Stereo Effect has to be switched on.</p> <p>It is worth mentioning, that all spatial effects affect amplitude and phase response. With the lower 4 bits, the frequency response can be customized. A value of 0_{hex} yields a flat response for center signals (L = R), but a high-pass function for L or R only signals. A value of 6_{hex} has a flat response for L or R only signals, but a low-pass function for center signals. By using 8_{hex}, the frequency response is automatically adapted to the sound material by choosing an optimal high-pass gain.</p>	SPAT_MAIN

00 1E _{hex}	MSP Hardware Version Code bit[15:8] 02 _{hex} MSP 34x1G - B8 A change in the hardware version code defines hardware optimizations that may have influence on the chip's behavior. The readout of this register is identical to the hardware version code in the chip's imprint. MSP Major Revision Code bit[7:0] 07 _{hex} MSP 34x1G - B8 The major revision code of the MSP 34x1G is 7.	MSP_HARD MSP_REVISION
00 1F _{hex}	MSP Product Code bit[15:8] 01 _{hex} MSP 3401G - B8 0B _{hex} MSP 3411G - B8 15 _{hex} MSP 3421G - B8 29 _{hex} MSP 3441G - B8 33 _{hex} MSP 3451G - B8 3D _{hex} MSP 3461G - B8 By means of the MSP-Product Code, the control processor is able to decide which TV sound standards have to be considered. MSP ROM Version Code bit[7:0] 41 _{hex} MSP 34x1G - A1 42 _{hex} MSP 34x1G - A2 48 _{hex} MSP 34x1G - B8 A change in the ROM version code defines internal software optimizations, that may have influence on the chip's behavior, e.g. new features may have been included. While a software change is intended to create no compatibility problems, customers that want to use the new functions can identify new MSP 34x1G versions according to this number. To avoid compatibility problems with MSP 3410B and MSP 34x0D, an offset of 40 _{hex} is added to the ROM version code of the chip's imprint.	MSP_PRODUCT MSP_ROM

3.4. Programming Tips

This section describes the preferred method for initializing the MSP 34x1G. The initialization is grouped into four sections:

- SCART Signal Path (analog signal path)
- Demodulator
- SCART and I²S Inputs
- Output Channels

See Fig. 2–1 on page 9 for a complete signal flow.

SCART Signal Path

1. Select analog input for the SCART baseband processing (SCART DSP Input Select) by means of the ACB register.
2. Select the source for each analog SCART output (SCART Output Select) by means of the ACB register.

Demodulator

For a complete setup of the TV sound processing from analog IF input to the source selection, the following steps must be performed:

1. Set MODUS register to the preferred mode and Sound IF input.
2. Choose preferred prescale (FM and NICAM) values.
3. Write STANDARD SELECT register.
4. If Automatic Sound Select is not active:
Choose FM matrix repeatedly according to the sound mode indicated in the STATUS register.

SCART and I²S Inputs

1. Select preferred prescale for SCART.
2. Select preferred prescale for I²S inputs (set to 0 dB after RESET).

Output Channels

1. Select the source channel and matrix for each output channel.
2. Set audio baseband processing.
3. Select volume for each output channel.

3.5. Examples of Minimum Initialization Codes

Initialization of the MSP 34x1G according to these listings reproduces sound of the selected standard on the loudspeaker output. All numbers are hexadecimal. The examples have the following structure:

1. Perform an I²C controlled reset of the IC.
2. Write MODUS register (with Automatic Sound Select).
3. Set Source Selection for loudspeaker channel (with matrix set to STEREO).
4. Set Prescale (FM and/or NICAM and dummy FM matrix).
5. Write STANDARD SELECT register.
6. Set Volume loudspeaker channel to 0 dB.

3.5.1. SCART1 Input to Loudspeaker in Stereo Sound

```
<80 00 80 00> // reset
<80 00 00 00>
<80 12 00 08 02 20> // source loudspeaker = scart, stereo
<80 12 00 0d 19 00> // prescale scart
<80 12 00 00 73 00> // volume main = 0dB
```

3.5.2. SCART1 Input to Loudspeaker in 3D-PANORAMA Sound

```
<80 00 80 00> // reset
<80 00 00 00>
<80 12 00 08 02 20> // source loudspeaker = scart, stereo
<80 12 00 0d 19 00> // prescale scart
<80 12 00 00 73 00> // volume main = 0dB
<80 12 00 48 01 00> // virtual surround sound: on
<80 12 00 49 40 00> // Surround spatial effect = 50%
<80 12 00 4a 54 00> // panorama sound effect = 66%
<80 12 00 4b 00 60> // Surround mode = 3d_panorama
<80 12 00 4d 00 00> // Noise Sequencer = off
```

3.5.3. Noise Sequencer for 3D-PANORAMA Sound

// switch into 3D-PANORAMA sound (s.a.). Then:

```
<80 12 00 4d 80 a0> // noise L
[wait for 2 seconds]
<80 12 00 4d 80 b0> // noise C
[wait for 2 seconds]
<80 12 00 4d 80 c0> // noise R
[wait for 2 seconds]
<80 12 00 4d 80 d0> // noise S
[wait for 2 seconds]
```

// switch back to normal operation

```
<80 12 00 4d 00 00> // Noise Sequencer = off
```

3.5.4. B/G-FM (A2 or NICAM)

```

<80 00 80 00> // Softreset
<80 00 00 00>
<80 10 00 30 20 03> // MODUS-Register: Automatic = on
<80 12 00 08 03 20> // Source Sel. = (St or A) & Ch. Matr. = St
<80 12 00 0E 24 03> // FM/AM-Prescale = 24hex,
                    FM-Matrix = MONO/SOUNDA
<80 12 00 10 5A 00> // NICAM-Prescale = 5Ahex
<80 10 00 20 00 03> // Standard Select: A2 B/G or NICAM B/G
                    or
<80 10 00 20 00 08>
<80 12 00 00 73 00> // Loudspeaker Volume 0 dB

```

3.5.5. BTSC-Stereo

```

<80 00 80 00> // Softreset
<80 00 00 00>
<80 10 00 30 20 03> // MODUS-Register: Automatic = on
<80 12 00 08 03 20> // Source Sel. = (St or A) & Ch. Matr. = St
<80 12 00 0E 24 03> // FM/AM-Prescale = 24hex,
                    FM-Matrix = Sound A Mono
<80 10 00 20 00 20> // Standard Select: BTSC-STEREO
<80 12 00 00 73 00> // Loudspeaker Volume 0 dB

```

3.5.6. BTSC-SAP with SAP at Loudspeaker Channel

```

<80 00 80 00> // Softreset
<80 00 00 00>
<80 10 00 30 20 03> // MODUS-Register: Automatic = on
<80 12 00 08 04 20> // Source Sel. = (St or B) & Ch. Matr. = St
<80 12 00 0E 24 03> // FM/AM-Prescale = 24hex,
                    FM-Matrix = Sound A Mono
<80 10 00 20 00 21> // Standard Select: BTSC-SAP
<80 12 00 00 73 00> // Loudspeaker Volume 0 dB

```

3.5.7. FM-Stereo Radio

```

<80 00 80 00> // Softreset
<80 00 00 00>
<80 10 00 30 20 03> // MODUS-Register: Automatic = on
<80 12 00 08 03 20> // Source Sel. = (St or A) & Ch. Matr. = St
<80 12 00 0E 24 03> // FM/AM-Prescale = 24hex,
                    FM-Matrix = Sound A Mono
<80 10 00 20 00 40> // Standard Select: FM-STEREO-RADIO
<80 12 00 00 73 00> // Loudspeaker Volume 0 dB

```

3.5.8. Automatic Standard Detection

A detailed software flow diagram is shown in Fig. 3–2 on page 47.

```

<80 00 80 00> // Softreset
<80 00 00 00>
<80 10 00 30 20 03> // MODUS-Register: Automatic = on
<80 12 00 08 03 20> // Source Sel. = (St or A) & Ch. Matr. = St
<80 12 00 0E 24 03> // FM/AM-Prescale = 24hex,
                    FM-Matrix = Sound A Mono
<80 12 00 10 5A 00> // NICAM-Prescale = 5Ahex
<80 10 00 20 00 01> // Standard Select:
                    Automatic Standard Detection

// Wait till STANDARD RESULT contains a value ≤ 07FF
// IF STANDARD RESULT contains 0000
// do some error handling

// ELSE
<80 12 00 00 73 00> // Loudspeaker Volume 0 dB

```

3.5.9. Software Flow for Interrupt driven STATUS Check

A detailed software flow diagram is shown in Fig. 3–2 on page 47.

If the D_CTR_I/O_1 pin of the MSP 34x1G is connected to an interrupt input pin of the controller, the following interrupt handler can be applied to be automatically called with each status change of the MSP 34x1G. The interrupt handler may adjust the TV display according to the new status information.

Interrupt Handler:

```

<80 11 02 00 <81 dd dd> // Read STATUS
// adjust TV display with given status information
// Return from Interrupt

```

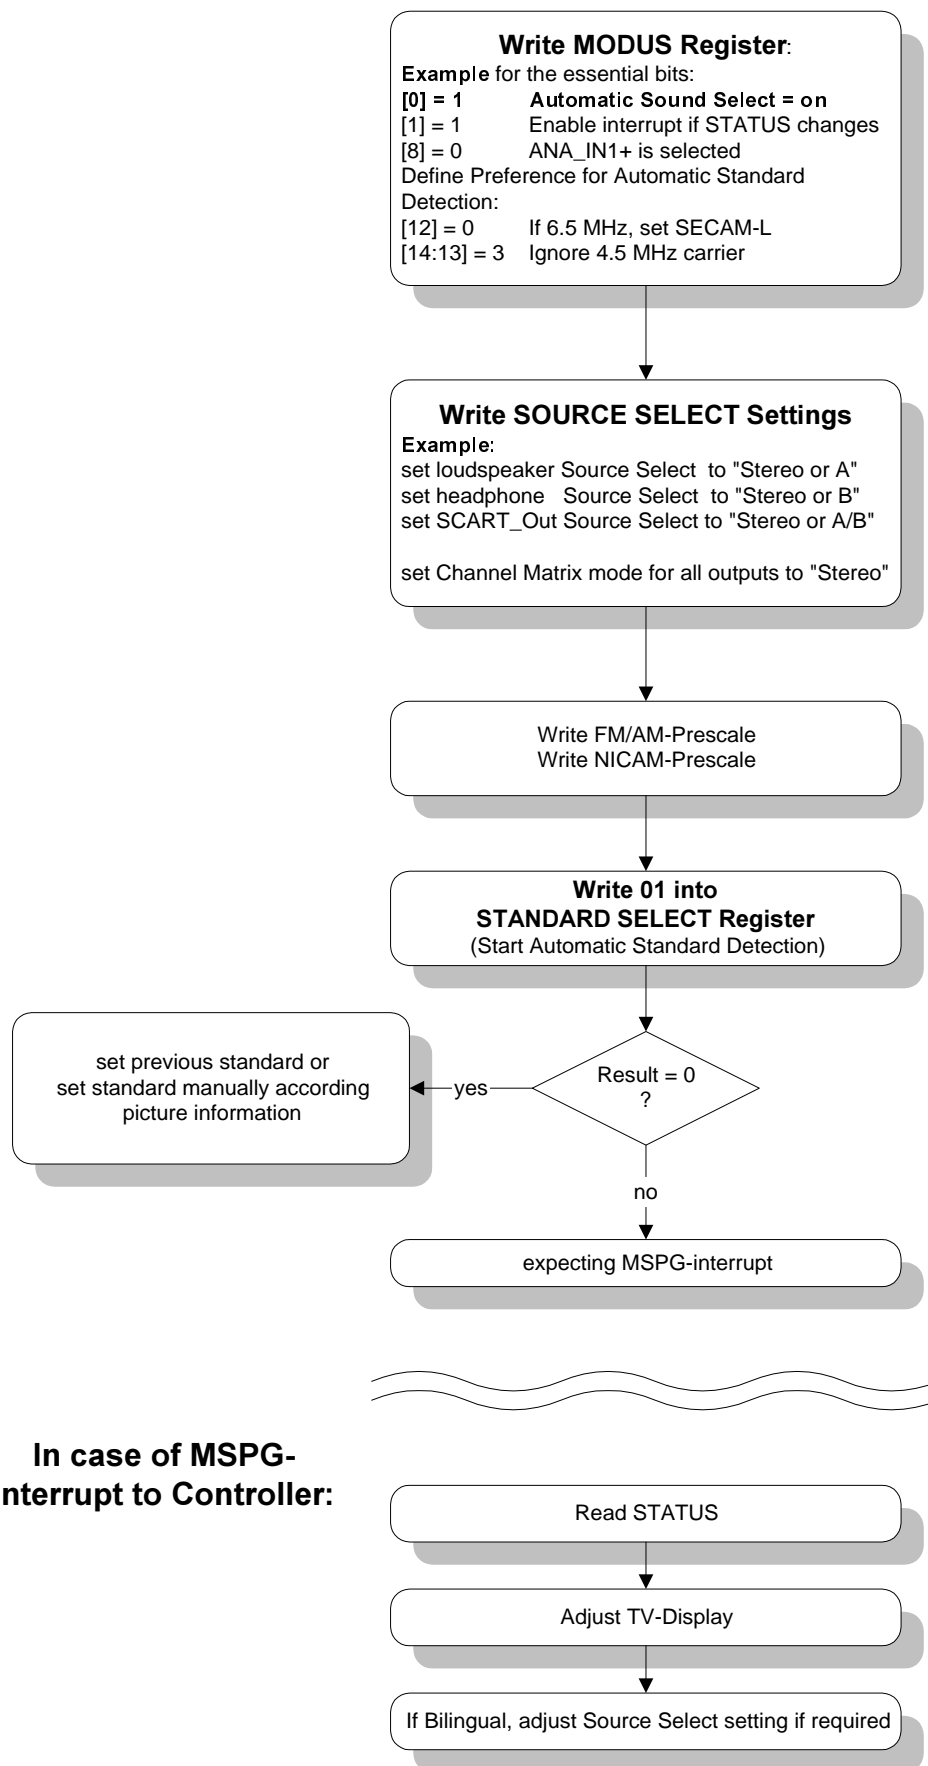

Fig. 3–2: Software flow diagram for a Minimum demodulator setup for a European Multistandard TV set applying the Automatic Sound Select feature

4.3. Pin Descriptions

Pin numbers refer to the PQFP80 package.

Pin 1, **NC** – Pin not connected.

Pin 2, **I2C_CL** – I²C Clock Input/Output (Fig. 4–18)
Via this pin, the I²C-bus clock signal has to be supplied. The signal can be pulled down by the MSP in case of wait conditions.

Pin 3, **I2C_DA** – I²C Data Input/Output (Fig. 4–18)
Via this pin, the I²C-bus data is written to or read from the MSP.

Pin 4, **I2S_CL** – I²S Clock Input/Output (Fig. 4–19)
Clock line for the I²S bus. In master mode, this line is driven by the MSP; in slave mode, an external I²S clock has to be supplied.

Pin 5, **I2S_WS** – I²S Word Strobe Input/Output (Fig. 4–19)
Word strobe line for the I²S bus. In master mode, this line is driven by the MSP; in slave mode, an external I²S word strobe has to be supplied.

Pin 6, **I2S_DA_OUT** – I²S Data Output (Fig. 4–23)
Output of digital serial sound data of the MSP on the I²S bus.

Pin 7, **I2S_DA_IN1** – I²S Data Input 1 (Fig. 4–15)
First input of digital serial sound data to the MSP via the I²S bus.

Pin 8, **ADR_DA** – ADR Bus Data Output (Fig. 4–23)
Output of digital serial data to the DRP 3510A via the ADR bus.

Pin 9, **ADR_WS** – ADR Bus Word Strobe Output (Fig. 4–23)
Word strobe output for the ADR bus.

Pin 10, **ADR_CL** – ADR Bus Clock Output (Fig. 4–23)
Clock line for the ADR bus.

Pins 11, 12, 13, **DVSUP*** – Digital Supply Voltage
Power supply for the digital circuitry of the MSP. Must be connected to a +5 V power supply.

Pins 14, 15, 16, **DVSS*** – Digital Ground
Ground connection for the digital circuitry of the MSP.

Pin 17, **I2S_DA_IN2** – I²S Data Input 2 (Fig. 4–15)
Second input of digital serial sound data to the MSP via the I²S bus.

Pins 18, 19, 20, **NC** – Pins not connected.

Pin 21, **RESETQ** – Reset Input (Fig. 4–11)
In the steady state, high level is required. A low level resets the MSP 34x1G.

Pins 22, 23, **NC** – Pins not connected.

Pins 24, 25, **DACA_R/L** – Headphone Outputs (Fig. 4–21)
Output of the headphone signal. A 1-nF capacitor to AHVSS must be connected to these pins. The DC offset on these pins depends on the selected headphone volume.

Pin 26, **VREF2** – Reference Ground 2
Reference analog ground. This pin must be connected separately to ground (AHVSS). VREF2 serves as a clean ground and should be used as the reference for analog connections to the loudspeaker and headphone outputs.

Pins 27, 28, **DACM_R/L** – Loudspeaker Outputs (Fig. 4–21)
Output of the loudspeaker signal. A 1-nF capacitor to AHVSS must be connected to these pins. The DC offset on these pins depends on the selected loudspeaker volume.

Pin 29, **NC** – Pin not connected.

Pin 30, **DACM_SUB** – Subwoofer Output (Fig. 4–21)
Output of the subwoofer signal. A 1-nF capacitor to AHVSS must be connected to this pin. Due to the low frequency content of the subwoofer output, the value of the capacitor may be increased for better suppression of high-frequency noise. The DC offset on this pin depends on the selected loudspeaker volume.

Pins 31, 32 **NC** – Pin not connected.

Pins 33, 34, **SC2_OUT_R/L** – SCART2 Outputs (Fig. 4–22)
Output of the SCART2 signal. Connections to these pins must use a 100-Ω series resistor and are intended to be AC-coupled.

Pin 35, **VREF1** – Reference Ground 1
Reference analog ground. This pin must be connected separately to ground (AHVSS). VREF1 serves as a clean ground and should be used as the reference for analog connections to the SCART outputs.

Pins 36, 37, **SC1_OUT_R/L** – SCART1 Outputs (Fig. 4–22)
Output of the SCART1 signal. Connections to these pins must use a 100-Ω series resistor and are intended to be AC-coupled.

Pin 38, **CAPL_A** – Volume Capacitor Headphone (Fig. 4–24)

A 10- μ F capacitor to AHVSUP must be connected to this pin. It serves as a smoothing filter for headphone volume changes in order to suppress audible pops. The value of the capacitor can be lowered to 1- μ F if faster response is required. The area encircled by the trace lines should be minimized; keep traces as short as possible. This input is sensitive for magnetic induction.

Pin 39, **AHVSUP*** – Analog Power Supply High Voltage

Power is supplied via this pin for the analog circuitry of the MSP (except IF input). This pin must be connected to the +8 V supply.

Pin 40, **CAPL_M** – Volume Capacitor Loudspeaker (Fig. 4–24)

A 10- μ F capacitor to AHVSUP must be connected to this pin. It serves as a smoothing filter for loudspeaker volume changes in order to suppress audible pops. The value of the capacitor can be lowered to 1 μ F if faster response is required. The area encircled by the trace lines should be minimized; keep traces as short as possible. This input is sensitive for magnetic induction.

Pins 41, 42, **NC** – Pins not connected.

Pins 43, 44, **AHVSS*** – Ground for Analog Power Supply High Voltage

Ground connection for the analog circuitry of the MSP (except IF input).

Pin 45, **AGNDC** – Internal Analog Reference Voltage

This pin serves as the internal ground connection for the analog circuitry (except IF input). It must be connected to the VREF pins with a 3.3- μ F and a 100-nF capacitor in parallel. This pins shows a DC level of typically 3.73 V.

Pin 46, **NC** – Pin not connected.

Pins 47, 48, **SC4_IN_L/R** – SCART4 Inputs (Fig. 4–14)

The analog input signal for SCART4 is fed to this pin. Analog input connection must be AC-coupled.

Pin 49, **ASG** – Analog Shield Ground

Analog ground (AHVSS) should be connected to this pin to reduce cross-coupling between SCART inputs.

Pins 50, 51, **SC3_IN_L/R** – SCART3 Inputs (Fig. 4–14)

The analog input signal for SCART3 is fed to this pin. Analog input connection must be AC-coupled.

Pin 52, **ASG** – Analog Shield Ground

Analog ground (AHVSS) should be connected to this pin to reduce cross-coupling between SCART inputs.

Pins 53, 54 **SC2_IN_L/R** – SCART2 Inputs (Fig. 4–14)

The analog input signal for SCART2 is fed to this pin. Analog input connection must be AC-coupled.

Pin 55, **ASG** – Analog Shield Ground

Analog ground (AHVSS) should be connected to this pin to reduce cross-coupling between SCART inputs.

Pins 56, 57 **SC1_IN_L/R** – SCART1 Inputs (Fig. 4–14)

The analog input signal for SCART1 is fed to this pin. Analog input connection must be AC-coupled.

Pin 58, **VREFTOP** – Reference Voltage IF A/D Converter (Fig. 4–16)

Via this pin, the reference voltage for the IF A/D converter is decoupled. It must be connected to AVSS pins with a 10- μ F and a 100-nF capacitor in parallel. Traces must be kept short.

Pin 59, **NC** – Pin not connected.

Pin 60 **MONO_IN** – Mono Input (Fig. 4–14)

The analog mono input signal is fed to this pin. Analog input connection must be AC-coupled.

Pins 61, 62, **AVSS*** – Analog Power Supply Voltage

Ground connection for the analog IF input circuitry of the MSP.

Pins 63, 64, **NC** – Pins not connected.

Pins 65, 66, **AVSUP*** – Ground for Analog Power Supply Voltage

Power is supplied via this pin for the analog IF input circuitry of the MSP. This pin must be connected to the +5 V supply.

Pin 67, **ANA_IN1+** – IF Input 1 (Fig. 4–16)

The analog sound IF signal is supplied to this pin. Inputs must be AC-coupled. This pin is designed as symmetrical input: ANA_IN1+ is internally connected to one input of a symmetrical op amp, ANA_IN- to the other.

Pin 68, **ANA_IN–** – IF Common (Fig. 4–16)

This pins serves as a common reference for ANA_IN1/2+ inputs.

Pin 69, **ANA_IN2+** – IF Input 2 (Fig. 4–16)

The analog sound if signal is supplied to this pin. Inputs must be AC-coupled. This pin is designed as symmetrical input: ANA_IN2+ is internally connected to one input of a symmetrical op amp, ANA_IN- to the other.

Pin 70, **TESTEN** – Test Enable Pin (Fig. 4–12)

This pin enables factory test modes. For normal operation, it must be connected to ground.

Pins 71, 72 **XTAL_IN, XTAL_OUT** – Crystal Input and Output Pins (Fig. 4–20)

These pins are connected to an 18.432 MHz crystal oscillator which is digitally tuned by integrated shunt capacitances. An external clock can be fed into XTAL_IN. The audio clock output signal AUD_CL_OUT is derived from the oscillator. External capacitors at each crystal pin to ground (AVSS) are required. It should be verified by layout, that no supply current for the digital circuitry is flowing through the ground connection point.

Pin 73, **TP** – This pin enables factory test modes. For normal operation, it must be left vacant.

Pin 74, **AUD_CL_OUT** – Audio Clock Output (Fig. 4–20)

This is the 18.432 MHz main clock output.

Pins 75, 76, **NC** – Pins not connected.

Pins 77, 78, **D_CTR_I/O_1/0** – Digital Control Input/Output Pins (Fig. 4–19)

General purpose input/output pins. Pin D_CTR_I/O_1 can be used as an interrupt request pin to the controller.

Pin 79, **ADR_SEL** – I²C Bus Address Select (Fig. 4–17)

By means of this pin, one of three device addresses for the MSP can be selected. The pin can be connected to ground (I²C device addresses 80/81_{hex}), to +5 V supply (84/85_{hex}), or left open (88/89_{hex}).

Pin 80, **STANDBYQ** – Stand-by

In normal operation, this pin must be high. If the MSP 34x1G is switched off by first pulling STANDBYQ low and then (after >1μs delay) switching off DVSUP and AVSUP, but keeping AHVSUP (**'Standby'-mode**), the SCART switches maintain their position and function.

* Application Note:

All ground pins should be connected to one low-resistive ground plane. All supply pins should be connected separately with short and low-resistive lines to the power supply. Decoupling capacitors from DVSUP to DVSS, AVSUP to AVSS, and AHVSUP to AHVSS are recommended as closely as possible to these pins. Decoupling of DVSUP and DVSS is most important. We recommend using more than one capacitor. By choosing different values, the frequency range of active decoupling can be extended. In our application boards we use: 220 pF, 470 pF, 1.5 nF, and 10 μF. The capacitor with the lowest value should be placed nearest to the DVSUP and DVSS pins.

The ASG pins should be connected as closely as possible to the MSP ground. If they are lead with the SCART-inputs as shielding lines, they should not be connected to ground at the SCART connector.

4.6.2.4. Crystal Recommendations

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit
General Crystal Recommendations						
f _P	Crystal Parallel Resonance Frequency at 12 pF Load Capacitance			18.432		MHz
R _R	Crystal Series Resistance			8	25	Ω
C ₀	Crystal Shunt (Parallel) Capacitance			6.2	7.0	pF
C _L	External Load Capacitance ¹⁾	XTAL_IN, XTAL_OUT	PSDIP approx. 1.5 P(L)QFP approx. 3.3			pF pF
Crystal Recommendations for Master-Slave Applications (MSP-clock must perform synchronization to I ² S clock)						
f _{TOL}	Accuracy of Adjustment		−20		+20	ppm
D _{TEM}	Frequency Variation versus Temperature		−20		+20	ppm
C ₁	Motional (Dynamic) Capacitance		19	24		fF
f _{CL}	Required Open Loop Clock Frequency (T _{amb} = 25 °C)	AUD_CL_OUT	18.431		18.433	MHz
Crystal Recommendations for FM / NICAM Applications (No MSP-clock synchronization to I ² S clock possible)						
f _{TOL}	Accuracy of Adjustment		−30		+30	ppm
D _{TEM}	Frequency Variation versus Temperature		−30		+30	ppm
C ₁	Motional (Dynamic) Capacitance		15			fF
f _{CL}	Required Open Loop Clock Frequency (T _{amb} = 25 °C)	AUD_CL_OUT	18.4305		18.4335	MHz
Crystal Recommendations for all analog FM/AM Applications (No MSP-clock synchronization to I ² S clock possible)						
f _{TOL}	Accuracy of Adjustment		−100		+100	ppm
D _{TEM}	Frequency Variation versus Temperature		−50		+50	ppm
f _{CL}	Required Open Loop Clock Frequency (T _{amb} = 25 °C)	AUD_CL_OUT	18.429		18.435	MHz
Amplitude Recommendation for Operation with External Clock Input (C _{load} after reset typ. 22 pF)						
V _{XCA}	External Clock Amplitude	XTAL_IN	0.7			V _{pp}
<div>1) External capacitors at each crystal pin to ground are required. They are necessary to tune the open-loop frequency of the internal PLL and to stabilize the frequency in closed-loop operation. Due to different layouts, <u>the accurate capacitor value should be determined with the customer PCB</u>. The suggested values (1.5...3.3 pF) are figures based on experience and should serve as “start value”.</div> <div>To adjust the capacitor value, reset the MSP. After the reset, no I²C telegrams should be transmitted. Measure the frequency at AUD_CL_OUT-pin. Change the capacitor value until the free running frequency matches 18.432 MHz as closely as possible. The higher the capacity, the lower the resulting clock frequency.</div> <div>Note: To minimize adjustment tolerances for all MSP-generations, it is strongly recommended to use the so-called MSP-XTAL-REF ICs (available in all packages) for the capacitor adjustment.</div>						

4.6.3. Characteristics

at $T_A = 0$ to $70\text{ }^{\circ}\text{C}$, $f_{\text{CLOCK}} = 18.432\text{ MHz}$, $V_{\text{SUP1}} = 7.6$ to 8.7 V , $V_{\text{SUP2}} = 4.75$ to 5.25 V for min./max. values

at $T_A = 60\text{ }^{\circ}\text{C}$, $f_{\text{CLOCK}} = 18.432\text{ MHz}$, $V_{\text{SUP1}} = 8\text{ V}$, $V_{\text{SUP2}} = 5\text{ V}$ for typical values,

T_J = Junction Temperature

MAIN (M) = Loudspeaker Channel, AUX (A) = Headphone Channel

4.6.3.1. General Characteristics

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit	Test Conditions
Supply							
I _{SUP1A}	First Supply Current (active) (AHVSUP = 8 V)	AHVSUP		17 11	25 16	mA mA	Vol. Main and Aux = 0 dB Vol. Main and Aux = -30dB
	First Supply Current (active) (AHVSUP = 5 V)			11 8	17 11	mA mA	Vol. Main and Aux = 0 dB Vol. Main and Aux = -30 dB
I _{SUP2A}	Second Supply Current (active)	DVSUP		55	70	mA	
I _{SUP3A}	Third Supply Current (active)	AVSUP		30	38	mA	
I _{SUP1S}	First Supply Current (AHVSUP = 8 V)	AHVSUP		5.6	7.7	mA	STANDBYQ = low
	First Supply Current (AHVSUP = 5 V)			3.7	5.1	mA	
Clock							
f _{CLOCK}	Clock Input Frequency	XTAL_IN		18.432		MHz	
D _{CLOCK}	Clock High to Low Ratio		45		55	%	
t _{JITTER}	Clock Jitter (Verification not provided in Production Test)				50	ps	
V _{xtalDC}	DC-Voltage Oscillator			2.5		V	
t _{Startup}	Oscillator Startup Time at VDD Slew-rate of 1 V/1 μs	XTAL_IN, XTAL_OUT		0.4	2	ms	
V _{ACLKAC}	Audio Clock Output AC Voltage	AUD_CL_OUT	1.2	1.8		V _{pp}	load = 40 pF
V _{ACLKDC}	Audio Clock Output DC Voltage		0.4		0.6	V _{SUP3}	I _{max} = 0.2 mA
r _{outHF_ACL}	HF Output Resistance			140		Ω	

4.6.3.2. Digital Inputs, Digital Outputs

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit	Test Conditions
Digital Input Levels							
V _{DIGIL}	Digital Input Low Voltage	STANDBYQ D_CTR_I/O_0/1			0.2	V _{SUP2}	
V _{DIGIH}	Digital Input High Voltage		0.5			V _{SUP2}	
Z _{DIGI}	Input Impedance				5	pF	
I _{DLEAK}	Digital Input Leakage Current		−1		1	μA	0 V < U _{INPUT} < DV _{SUP} D_CTR_I/O_0/1: tri-state
V _{DIGIL}	Digital Input Low Voltage	ADR_SEL			0.2	V _{SUP2}	
V _{DIGIH}	Digital Input High Voltage		0.8			V _{SUP2}	
I _{ADRSEL}	Input Current Address Select Pin		−500	−220		μA	U _{ADR_SEL} = DV _{SS}
				220	500	μA	U _{ADR_SEL} = DV _{SUP}
Digital Output Levels							
V _{DCTROL}	Digital Output Low Voltage	D_CTR_I/O_0 D_CTR_I/O_1			0.4	V	IDDC _{TR} = 1 mA
V _{DCTROH}	Digital Output High Voltage		V _{SUP2} −0.3			V	IDDC _{TR} = −1 mA

4.6.3.3. Reset Input and Power-Up

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit	Test Conditions
RESETQ Input Levels							
V_{RHL}	Reset High-Low Transition Voltage	RESETQ	0.3		0.4	V_{SUP2}	
V_{RLH}	Reset Low-High Transition Voltage		0.45		0.55	V_{SUP2}	
Z_{RES}	Input Capacitance				5	pF	
I_{RES}	Input High Current				20	μA	$U_{RESETQ} = DVSUP$

5. Appendix A: Overview of TV-Sound Standards

5.1. NICAM 728

Table 5–1: Summary of NICAM 728 sound modulation parameters

Specification	I	B/G	L		D/K	
Carrier frequency of digital sound	6.552 MHz	5.85 MHz	5.85 MHz		5.85 MHz	
Transmission rate	728 kbit/s					
Type of modulation	Differentially encoded quadrature phase shift keying (DQPSK)					
Spectrum shaping Roll-off factor	by means of Roll-off filters					
	1.0	0.4	0.4		0.4	
Carrier frequency of analog sound component	6.0 MHz FM mono	5.5 MHz FM mono	6.5 MHz AM mono		6.5 MHz FM mono	
			terrestrial	cable		
Power ratio between vision carrier and analog sound carrier	10 dB	13 dB	10 dB	16 dB	13 dB	
Power ratio between analog and modulated digital sound carrier	10 dB	7 dB	17 dB	11 dB	China/ Hungary	Poland
					12 dB	7 dB

Table 5–2: Summary of NICAM 728 sound coding characteristics

Characteristics	Values
Audio sampling frequency	32 kHz
Number of channels	2
Initial resolution	14 bit/sample
Companding characteristics	near instantaneous, with compression to 10 bits/sample in 32-samples (1 ms) blocks
Coding for compressed samples	2's complement
Preemphasis	CCITT Recommendation J.17 (6.5 dB attenuation at 800 Hz)
Audio overload level	+12 dBm measured at the unity gain frequency of the preemphasis network (2 kHz)

5.2. A2-Systems

Table 5–3: Key parameters for A2 Systems of Standards B/G, D/K, and M

Characteristics	Sound Carrier FM1			Sound Carrier FM2		
TV-Sound Standard	B/G	D/K	M	B/G	D/K	M
Carrier frequency in MHz	5.5	6.5	4.5	5.7421875	6.2578125 6.7421875 5.7421875	4.724212
Vision/sound power difference	13 dB			20 dB		
Sound bandwidth	40 Hz to 15 kHz					
Preemphasis	50 μs		75 μs	50 μs		75 μs
Frequency deviation (nom/max)	±27/±50 kHz		±17/±25 kHz	±27/±50 kHz		±15/±25 kHz
Transmission Modes						
Mono transmission	mono			mono		
Stereo transmission	(L+R)/2		(L+R)/2	R		(L–R)/2
Dual sound transmission	language A			language B		
Identification of Transmission Mode						
Pilot carrier frequency				54.6875 kHz		55.0699 kHz
Max. deviation portion				±2.5 kHz		
Type of modulation / modulation depth				AM / 50%		
Modulation frequency				mono: unmodulated stereo: 117.5 Hz dual: 274.1 Hz		149.9 Hz 276.0 Hz

5.3. BTSC-Sound System

Table 5–4: Key parameters for BTSC-Sound Systems

	Aural Carrier	BTSC-MPX-Components				
		(L+R)	Pilot	(L–R)	SAP	Prof. Ch.
Carrier frequency ($f_{hNTSC} = 15.734 \text{ kHz}$) ($f_{hPAL} = 15.625 \text{ kHz}$)	4.5 MHz	Baseband	f_h	$2 f_h$	$5 f_h$	$6.5 f_h$
Sound bandwidth in kHz		0.05 - 15		0.05 - 15	0.05 - 12	0.05 - 3.4
Preemphasis		75 μs		DBX	DBX	150 μs
Max. deviation to Aural Carrier	73 kHz (total)	25 kHz ¹⁾	5 kHz	50 kHz ¹⁾	15 kHz	3 kHz
Max. Freq. Deviation of Subcarrier Modulation Type				AM	10 kHz FM	3 kHz FM
¹⁾ Sum does not exceed 50 kHz due to interleaving effects						

5.4. Japanese FM Stereo System (EIA-J)

Table 5–5: Key parameters for Japanese FM-Stereo Sound System EIA-J

	Aural Carrier FM	EIA-J-MPX-Components		
		(L+R)	(L–R)	Identification
Carrier frequency ($f_h = 15.734 \text{ kHz}$)	4.5 MHz	Baseband	$2 f_h$	$3.5 f_h$
Sound bandwidth		0.05 - 15 kHz	0.05 - 15 kHz	–
Preemphasis		75 μs	75 μs	none
Max. deviation portion to Aural Carrier	47 kHz	25 kHz	20 kHz	2 kHz
Max. Freq. Deviation of Subcarrier Modulation Type			10 kHz FM	60% AM
Transmitter-sided delay		20 μs	0 μs	0 μs
Mono transmission		L+R	–	unmodulated
Stereo transmission		L+R	L–R	982.5 Hz
Bilingual transmission		Language A	Language B	922.5 Hz

5.5. FM Satellite Sound

Table 5–6: Key parameters for FM Satellite Sound

Carrier Frequency	Maximum FM Deviation	Sound Mode	Bandwidth	Deemphasis
6.5 MHz	85 kHz	Mono	15 kHz	50 μ s
7.02/7.20 MHz	50 kHz	Mono/Stereo/Bilingual	15 kHz	adaptive
7.38/7.56 MHz	50 kHz	Mono/Stereo/Bilingual	15 kHz	adaptive
7.74/7.92 MHz	50 kHz	Mono/Stereo/Bilingual	15 kHz	adaptive

5.6. FM-Stereo Radio

Table 5–7: Key parameters for FM-Stereo Radio Systems

	Aural Carrier	FM-Radio-MPX-Components			
		(L+R)	Pilot	(L–R)	RDS/ARI
Carrier frequency ($f_p = 19$ kHz)	10.7 MHz	Baseband	f_p	$2 f_p$	$3 f_h$
Sound bandwidth in kHz		0.05 - 15		0.05 - 15	
Preemphasis: – USA – Europe		75 μ s 50 μ s		75 μ s 50 μ s	
Max. deviation to Aural Carrier	75 kHz (100%)	90%	10%	90%	5%

6. Appendix B: Manual/Compatibility Mode

To adapt the modes of the STANDARD SELECT register to individual requirements and for reasons of **compatibility to the MSP 34x0D**, the MSP 34x1G offers an Manual/Compatibility Mode, which provides sophisticated programming of the MSP 34x1G.

Using the STANDARD SELECT register generally provides a more economic way to program the MSP 34x1G and will result in optimal behavior. **Therefore, it is not recommend to use the Manual/Compatibility mode.** In those cases, where the MSP 34xxD is to be substituted by the MSP 34x1G, the tips given in Section 6.10. on page 101 have to be obeyed by the controller software.

6.1. Demodulator Write and Read Registers for Manual/Compatibility Mode

Table 6–1: Demodulator Write Registers; Subaddress: 10_{hex}; these registers are not readable!

Demodulator Write Registers	Address (hex)	MSP-Version	Description	Reset Mode	Page
AUTO_FM/AM	00 21	3411, 3451	1. MODUS[0]=1 (Automatic Sound Select): Switching Level threshold of Automatic Switching between NICAM and FM/AM in case of bad NICAM reception 2. MODUS[0]=0 (Manual Mode): Activation and configuration of Automatic Switching between NICAM and FM/AM in case of bad NICAM reception	00 00	87
A2_Threshold	00 22	all	A2 Stereo Identification Threshold	00 19 _{hex}	89
CM_Threshold	00 24	all	Carrier-Mute Threshold	00 2A _{hex}	89
AD_CV	00 BB	all	SIF-input selection, configuration of AGC, and Carrier-Mute Function	00 00	90
MODE_REG	00 83	3411, 3451	Controlling of MSP-Demodulator and Interface options. As soon as this register is applied, the MSP 34x1G works in the MSP 34x0D Compatibility Mode . Warning: In this mode, BTSC, EIA-J, and FM-Radio are disabled. Only MSP 34x0D features are available; the use of MODUS and STATUS register is not allowed. The MSP 34x1G is reset to the normal mode by first programming the MODUS register followed by transmitting a valid standard code to the STANDARD SELECTION register.	00 00	91
FIR1 FIR2	00 01 00 05		FIR1-filter coefficients channel 1 (6 · 8 bit) FIR2-filter coefficients channel 2 (6 · 8 bit), + 3 · 8 bit offset (total 72 bit)	00 00	93
DCO1_LO DCO1_HI DCO2_LO DCO2_HI	00 93 00 9B 00 A3 00 AB		Increment channel 1 Low Part Increment channel 1 High Part Increment channel 2 Low Part Increment channel 2 High Part	00 00	93
PLL_CAPS	00 1F		Not of interest for the customer Switchable PLL capacitors to tune open-loop frequency	00 56	96

Note: All registers except AUTO_FM/AM, A2_Threshold, and CM_Threshold are initialized during STANDARD SELECTION and are automatically updated when Automatic Sound Select (MODUS[0]=1) is on.

Table 6–2: Demodulator Read Registers; Subaddress: 11_{hex}; these registers are not writable!

Demodulator Read Registers	Address (hex)	MSP-Version	Description	Page
C_AD_BITS	00 23	3411, 3451	NICAM-Sync bit, NICAM-C-Bits, and three LSBs of additional data bits	95
ADD_BITS	00 38		NICAM: bit[10:3] of additional data bits	95
CIB_BITS	00 3E		NICAM: CIB1 and CIB2 control bits	95
ERROR_RATE	00 57		NICAM error rate, updated with 182 ms	96
PLL_CAPS	02 1F		Not for customer use	96
AGC_GAIN	02 1E		Not for customer use	96

6.2. DSP Write and Read Registers for Manual/Compatibility Mode

Table 6–3: DSP-Write Registers; Subaddress: 12_{hex}, all registers are readable as well

Write Register	Address (hex)	Bits	Operational Modes and Adjustable Range	Reset Mode	Page
Volume SCART1 channel: Ctrl. mode	00 07	[7:0]	[Linear mode / logarithmic mode]	00 _{hex}	97
FM Fixed Deemphasis	00 0F	[15:8]	[50 μs, 75 μs, J17, OFF]	50 μs	97
FM Adaptive Deemphasis		[7:0]	[OFF, WP1]	OFF	97
Identification Mode	00 15	[7:0]	[B/G, M]	B/G	98
FM DC Notch	00 17	[7:0]	[ON, OFF]	ON	98
Volume SCART2 channel: Ctrl. mode	00 40	[7:0]	[Linear mode / logarithmic mode]	00 _{hex}	97

Table 6–4: DSP Read Registers; Subaddress: 13_{hex}, all registers are not writable

Additional Read Registers	Address (hex)	Bits	Output Range	Page
Stereo detection register for A2 Stereo Systems	00 18	[15:8]	[80 _{hex} ... 7F _{hex}] 8 bit two's complement	98
DC level readout FM1/Ch2-L	00 1B	[15:0]	[8000 _{hex} ... 7FFF _{hex}] 16 bit two's complement	98
DC level readout FM2/Ch1-R	00 1C	[15:0]	[8000 _{hex} ... 7FFF _{hex}] 16 bit two's complement	98

6.3. Manual/Compatibility Mode: Description of Demodulator Write Registers

6.3.1. Automatic Switching between NICAM and Analog Sound

In case of bad NICAM reception or loss of the NICAM-carrier, the MSP 34x1G offers an Automatic Switching (fall back) to the analog sound (FM/AM-mono), without the necessity for the controller of reading and evaluating any parameters. If a proper NICAM signal returns, switching back to this source is performed automatically as well. The feature evaluates the NICAM ERROR_RATE and switches, if necessary, all output channels which are assigned to the NICAM-source, to the analog source, and vice versa.

An appropriate hysteresis algorithm avoids oscillating effects (see Fig. 6–1). STATUS[9] and C_AD_BITS[11] (Addr: 0023 hex) provide information about the actual NICAM-FM/AM-status.

Fig. 6–1: Hysteresis for Automatic Switching

6.3.1.1. Function in Automatic Sound Select Mode

The Automatic Sound Select feature (MODUS[0]=1) includes the procedure mentioned above. By default, the internal ERROR_RATE threshold is set to 700_{dec}. i.e.:

- NICAM → analog Sound if ERROR_RATE > 700
- analog Sound → NICAM if ERROR_RATE < 700/2

The ERROR_RATE value of 700 corresponds to a BER of approximately $5.46 \cdot 10^{-3}$ /s.

Individual configuration of the threshold can be done using Table 6–5. However, the internal setting used by the standard selection is recommended.

The optimum NICAM sound can be assigned to the MSP output channels by selecting one of the “Stereo or A/B”, “Stereo or A”, or “Stereo or B” source channels

6.3.1.2. Function in Manual Mode

If the manual mode (MODUS[0]=0) is required, the activation and configuration of the Automatic Switching feature has to be done as described in Table 6–6. Note, that the channel matrix of the corresponding output-channels must be set according to the NICAM-mode and need not to be changed in the FM/AM-fallback case.

Example:

Required threshold = 500: bits[10:1] = 00 1111 1010

Table 6–5: Coding of Automatic NICAM/Analog Sound Switching;
Automatic Sound Select is on (MODUS[0] = 1)

Mode	Description	AUTO_FM [11:0] Addr. = 00 21 _{hex}	ERROR_RATE- Threshold/dec	Source Select: Input at NICAM Path ¹⁾
1 Default	Automatic Switching with internal threshold	bit[11:0] = 0	700	NICAM or FM/AM, depending on ERROR_RATE
2	Automatic Switching with external threshold (Customizing of Automatic Sound Select)	bit[11] = 0 bit[10:1] = 25...1000 = threshold/2 bit[0] = 1	set by customer; recommended range: 50...2000	
3	Forced Analog Mono	bit[11] = 1 bit[10:1] = ignored bit[0] = 1		always FM/AM
¹⁾ The NICAM path may be assigned to “Stereo or A/B”, “Stereo or A”, or “Stereo or B” source channels (see Table 2–2 on page 12).				

Table 6–6: Coding of Automatic NICAM/Analog Sound Switching;
Automatic Sound Select is off (MODUS[0] = 0)

Mode	Description	AUTO_FM [11:0] Addr. = 00 21 _{hex}	ERROR_RATE- Threshold/dec	Source Select: Input at NICAM Path
0 reset status	Forced NICAM (Automatic Switching disabled)	bit[11] = 0 bit[10:1] = 0 bit[0] = 0	none	always NICAM; Mute in case of no NICAM available
1	Automatic Switching with internal threshold (Default, if Automatic Sound Select is on)	bit[11] = 0 bit[10:1] = 0 bit[0] = 1	700	NICAM or FM/AM, depending on ERROR_RATE
2	Automatic Switching with external threshold (Customizing of Automatic Sound Select)	bit[11] = 0 bit[10:1] = 25...1000 = threshold/2 bit[0] = 1	set by customer; recommended range: 50...2000	
3	Forced Analog Mono (Automatic Switching disabled)	bit[11] = 1 bit[10:1] = 0 bit[0] = 1	none	always FM/AM

6.3.2. A2 Threshold

The threshold between Stereo/Bilingual and Mono Identification for the A2 Standard has been made programmable according to the user's preferences. An internal hysteresis ensures robustness and stability.

Table 6–7: Write Register on I²C Subaddress 10_{hex} : A2 Threshold

Register Address	Function	Name
THRESHOLDS		
00 22 _{hex} (write)	A2 THRESHOLD Register Defines threshold of all A2 and EIA_J standards for Stereo and Bilingual detection bit[15:0] 07F0 _{hex} force Mono Identification ... 0190 _{hex} default setting after reset ... 00A0 _{hex} minimum Threshold for stable detection recommended range : 00A0 _{hex} ...03C0 _{hex}	A2_THRESH

6.3.3. Carrier-Mute Threshold

The Carrier-Mute threshold has been made programmable according to the user's preferences. An internal hysteresis ensures stable behavior.

Table 6–8: Write Register on I²C Subaddress 10_{hex} : Carrier-Mute Threshold

Register Address	Function	Name
THRESHOLDS		
00 24 _{hex} (write)	Carrier-Mute THRESHOLD Register Defines threshold for the carrier mute feature bit[15:0] 0000 _{hex} Carrier-Mute always ON (both channels muted) ... 002A _{hex} default setting after reset ... 07FF _{hex} Carrier-Mute always OFF (both channels forced on) recommended range : 0014 _{hex} ...0050 _{hex}	CM_THRESH

6.3.4. Register AD_CV

The use of this register is no longer recommended. Use it only in cases where compatibility to the MSP 34x0D is required. Using the STANDARD SELECTION register together with the MODUS register provides a more economic way to program the MSP 34x1G.

Table 6–9: AD_CV Register; reset status: all bits are “0”

AD_CV (00 BB _{hex})			Automatic setting by STANDARD SELECT Register	
Bit	Function	Settings	2-8, 0A-60 _{hex}	9
[0]	not used	must be set to 0	0	0
[1:6]	Reference level in case of Automatic Gain Control = on (see Table 6–10). Constant gain factor when Automatic Gain Control = off (see Table 6–11).		101000	100011
[7]	Determination of Automatic Gain or Constant Gain	0 = constant gain 1 = automatic gain	1	1
[8]	Selection of Sound IF source (identical to MODUS[8])	0 = ANA_IN1+ 1 = ANA_IN2+	X	X
[9]	MSP-Carrier-Mute Feature	0 = off: no mute 1 = on: mute as described in section 2.2.2.	1	0
[10:15]	not used	must be set to 0	0	0
X : not affected while choosing the TV sound standard by means of the STANDARD SELECT Register				

Note: This register is initialized during STANDARD SELECTION and is automatically updated when Automatic Sound Select (MODUS[0]=1) is on.

Table 6–10: Reference Values for Active AGC (AD_CV[7] = 1)

Application	Input Signal Contains	AD_CV [6:1] Ref. Value	AD_CV [6:1] in integer	Range of Input Signal at pin ANA_IN1+ and ANA_IN2+
Terrestrial TV				
– FM Standards	1 or 2 FM Carriers	101000	40	0.10 – 3 V _{pp} ¹⁾
– NICAM/FM	1 FM and 1 NICAM Carrier	101000	40	0.10 – 3 V _{pp} ¹⁾
– NICAM/AM	1 AM and 1 NICAM Carrier	100011	35	0.10 – 1.4 V _{pp} (recommended: 0.10 – 0.8 V _{pp})
– NICAM only	1 NICAM Carrier only	010100	20	0.05 – 1.0 V _{pp}
SAT	1 or more FM Carriers	100011	35	0.10 – 3 V _{pp} ¹⁾
ADR	FM and ADR carriers	see DRP 3510A data sheet		
1) For signals above 1.4 V _{pp} , the minimum gain of 3 dB is switched, and overflow of the A/D converter may result. Due to the robustness of the internal processing, the IC works up to and even more than 3 V _{pp} , if norm conditions of FM/NICAM or FM1/FM2 ratio are supposed. In this overflow case, a loss of FM-S/N ratio of about 10 dB may appear.				

Table 6–11: AD_CV parameters for Constant Input Gain (AD_CV[7]=0)

Step	AD_CV [6:1] Constant Gain	Gain	Input Level at pin ANA_IN1+ and ANA_IN2+
0	000000	3.00 dB	maximum input level: 3 V _{pp} (FM) or 1 V _{pp} (NICAM) ¹⁾
1	000001	3.85 dB	
2	000010	4.70 dB	
3	000011	5.55 dB	
4	000100	6.40 dB	
5	000101	7.25 dB	
6	000110	8.10 dB	
7	000111	8.95 dB	
8	001000	9.80 dB	
9	001001	10.65 dB	
10	001010	11.50 dB	
11	001011	12.35 dB	
12	001100	13.20 dB	
13	001101	14.05 dB	
14	001110	14.90 dB	
15	001111	15.75 dB	
16	010000	16.60 dB	
17	010001	17.45 dB	
18	010010	18.30 dB	
19	010011	19.15 dB	
20	010100	20.00 dB	maximum input level: 0.14 V _{pp}
¹⁾ For signals above 1.4 V _{pp} , the minimum gain of 3 dB is switched and overflow of the A/D converter may result. Due to the robustness of the internal processing, the IC works up to and even more than 3 V _{pp} , if norm conditions of FM/NICAM or FM1/FM2 ratio are supposed. In this overflow case, a loss of FM-S/N ratio of about 10 dB may appear.			

6.3.5. Register MODE_REG

Note: The use of this register is no longer recommended. It should be used only in cases where software compatibility to the MSP 34x0D is required. Using the STANDARD SELECTION register together with the MODUS register provides a more economic way to program the MSP 34x1G.

As soon as this register is applied, the MSP 34x1G works in the **MSP 34x0D Manual/Compatibility Mode**. In this mode, **BTSC, EIA-J, and FM-Radio are disabled**. Only MSP 34x0D features are available; the use of MODUS and STATUS register is not allowed. The MSP 34x1G is reset to the normal mode by first programming the MODUS register, followed by transmitting a valid standard code to the STANDARD SELECTION register.

The register 'MODE_REG' contains the control bits determining the operation mode of the MSP 34x1G in the MSP 34x0D Manual/Compatibility Mode; Table 6–12 explains all bit positions.

Table 6–12: Control word 'MODE_REG'; reset status: all bits are "0"

MODE_REG 00 83 _{hex}				Automatic setting by STANDARD SELECT Register		
Bit	Function	Comment	Definition	2 - 5	8, A, B	9
[0]	not used		0 : must be used	0	0	0
[1]	DCTR_TRI	Digital control out 0/1 tri-state	0 : active 1 : tri-state	X	X	X
[2]	I2S_TRI	I ² S outputs tri-state (I2S_CL, I2S_WS, I2S_DA_OUT)	0 : active 1 : tri-state	X	X	X
[3]	I ² S Mode ¹⁾	Master/Slave mode of the I ² S bus	0 : Master 1 : Slave	X	X	X
[4]	I2S_WS Mode	WS due to the Sony or Philips-Format	0 : Sony 1 : Philips	X	X	X
[5]	Audio_CL_OUT	Switch Audio_Clock_Output to tri-state	0 : on 1 : tri-state	X	X	X
[6]	NICAM ¹⁾	Mode of MSP-Ch1	0 : FM 1 : Nicam	0	1	1
[7]	not used		0 : must be used	0	0	0
[8]	FM AM	Mode of MSP-Ch2	0 : FM 1 : AM	0	0	1
[9]	HDEV	High Deviation Mode (channel matrix must be sound A)	0 : normal 1 : high deviation mode	0	0	0
[11:10]	not used		0 : must be used	0	0	0
[12]	MSP-Ch1 Gain	see also Table 6–14	0 : Gain = 6 dB 1 : Gain = 0 dB	0	0	0

[14]	ADR	Mode of MSP-Ch1/ ADR-Interface	0 : normal mode/tri-state 1 : ADR-mode/active	0	0	0
[15]	AM-Gain	Gain for AM Demodulation	0 : 0 dB (default. of MSPB) 1 : 12 dB (recommended)	1	1	1
¹⁾ NICAM and I ² S-Master mode are not allowed simultaneously				X: not affected by STANDARD SELECT Register		

Table 6–13: Loading sequence for FIR-coefficients

FIR1 00 01 _{hex} (MSP-Ch1: NICAM/FM2)			
No.	Symbol Name	Bits	Value
1	NICAM/FM2_Coeff. (5)	8	see Table 6–14
2	NICAM/FM2_Coeff. (4)	8	
3	NICAM/FM2_Coeff. (3)	8	
4	NICAM/FM2_Coeff. (2)	8	
5	NICAM/FM2_Coeff. (1)	8	
6	NICAM/FM2_Coeff. (0)	8	
FIR2 00 05 _{hex} (MSP-Ch2: FM1/AM)			
No.	Symbol Name	Bits	Value
1	IMREG1	8	04 _{hex}
2	IMREG1/IMREG2	8	40 _{hex}
3	IMREG2	8	00 _{hex}
4	FM/AM_Coef (5)	8	see Table 6–14
5	FM/AM_Coef (4)	8	
6	FM/AM_Coef (3)	8	
7	FM/AM_Coef (2)	8	
8	FM/AM_Coef (1)	8	
9	FM/AM_Coef (0)	8	

6.3.6. FIR-Parameter, Registers FIR1 and FIR2

Note: The use of this register is no longer recommended. It should be used only in cases where software compatibility to the MSP 34x0D is required. Using the STANDARD SELECTION register together with the MODUS register provides a more economic way to program the MSP 34x1G.

Data-shaping and/or FM/AM bandwidth limitation is performed by a pair of linear phase Finite Impulse Response filters (FIR-filter). The filter coefficients are programmable and are either configured automatically by the STANDARD SELECT register or written manually by the control processor via the control bus. Two not necessarily different sets of coefficients are required: one for MSP-Ch1 (NICAM or FM2) and one for MSP-Ch2 (FM1 = FM-mono). In Table 6–14 several coefficient sets are proposed.

To load the FIR-filters, the following data values are to be transferred **8 bits at a time embedded LSB-bound in a 16-bit word**.

The loading sequences must be obeyed. To change a coefficient set, the complete block FIR1 or FIR2 must be transmitted.

Note: For compatibility with MSP 3410B, IMREG1 and IMREG2 have to be transmitted. The value for IMREG1 and IMREG2 is 004. Due to the partitioning to 8-bit units, the values 04_{hex}, 40_{hex}, and 00_{hex} arise.

6.3.7. DCO-Registers

Note: The use of this register is no longer recommended. It should be used only in cases where software-compatibility to the MSP 34x0D is required. Using the STANDARD SELECTION register together with the MODUS register provides a more economic way to program the MSP 34x1G.

When selecting a TV-sound standard by means of the STANDARD SELECT register, all frequency tuning is performed automatically.

If manual setting of the tuning frequency is required, a set of 24-bit registers determining the mixing frequencies of the quadrature mixers can be written manually into the IC. In Table 6–15, some examples of DCO registers are listed. It is necessary to divide them up into low part and high part. The formula for the calculation of the registers for any chosen IF frequency is as follows:

$$\text{INCR}_{\text{dec}} = \text{int}(f/\text{fs} \cdot 2^{24})$$

with: int = integer function
 f = IF frequency in MHz
 f_s = sampling frequency (18.432 MHz)

Conversion of INCR into hex-format and separation of the 12-bit low and high parts lead to the required register values (DCO1_HI or _LO for MSP-Ch1, DCO2_HI or LO for MSP-Ch2).

Table 6–14: 8-bit FIR-coefficients (decimal integer); reset status: all coefficients are “0”

Coefficients for FIR1 00 01 _{hex} and FIR2 00 05 _{hex}														
	Terrestrial TV Standards							FM - Satellite FIR filter corresponds to a band-pass with a band-width of B = 130 to 500 kHz						
	B/G-, D/K-NICAM-FM		I-NICAM-FM		L-NICAM-AM		B/G-, D/K-, M-Dual FM	130 kHz	180 kHz	200 kHz	280 kHz	380 kHz	500 kHz	Auto-search
Coef(i)	FIR1	FIR2	FIR1	FIR2	FIR1	FIR2	FIR2	FIR2	FIR2	FIR2	FIR2	FIR2	FIR2	FIR2
0	−2	3	2	3	−2	−4	3	73	9	3	−8	−1	−1	−1
1	−8	18	4	18	−8	−12	18	53	18	18	−8	−9	−1	−1
2	−10	27	−6	27	−10	−9	27	64	28	27	4	−16	−8	−8
3	10	48	−4	48	10	23	48	119	47	48	36	5	2	2
4	50	66	40	66	50	79	66	101	55	66	78	65	59	59
5	86	72	94	72	86	126	72	127	64	72	107	123	126	126
Mode-REG[12]	0		0		0		0	1	1	1	1	1	1	0
Mode-REG[13]	0		0		0		1	1	1	1	1	1	1	0
For compatibility, except for the FIR2-AM and the Autosearch-sets, the FIR-filter programming as used for the MSP 3410B is also possible.														
ADR coefficients are listed in the DRP data sheet.														

Table 6–15: DCO registers for the MSP 34x1G; reset status: DCO_HI/LO = “0000”

DCO1_LO 00 93 _{hex} , DCO1_HI 00 9B _{hex} ; DCO2_LO 00 A3 _{hex} , DCO2_HI 00 AB _{hex}					
Freq. MHz	DCO_HI/hex	DCO_LO/hex	Freq. MHz	DCO_HI/hex	DCO_LO/hex

7.38	0668	0000	7.56	0690	0000

6.4. Manual/Compatibility Mode: Description of Demodulator Read Registers

Note: The use of these register is no longer recommended. It should be used only in cases where software compatibility to the MSP 34x0D is required. Using the STANDARD_SELECTION register together with the STATUS register provides a more economic way to program the MSP 34x1G and to retrieve information from the IC.

All registers except C_AD_BITS are 8 bits wide. They can be read out of the RAM of the MSP 34x1G if the MSP 34x0D Compatibility Mode is required.

All transmissions take place in 16-bit words. The valid 8-bit data are the 8 LSBs of the received data word.

If the Automatic Sound Select feature is not used, the NICAM or FM-identification parameters must be read and evaluated by the controller in order to enable appropriate switching of the channel select matrix of the baseband processing part. The FM-identification registers are described in section 6.6.1. To handle the NICAM-sound and to observe the NICAM-quality, at least the registers C_AD_BITS and ERROR_RATE must be read and evaluated by the controller. Additional data bits and CIB bits, if supplied by the NICAM transmitter, can be obtained by reading the registers ADD_BITS and CIB_BITS.

6.4.1. NICAM Mode Control/Additional Data Bits Register

NICAM operation mode control bits and A[2:0] of the additional data bits.

Format:

MSB		C_AD_BITS 00 23 _{hex}							LSB
11	...	7	6	5	4	3	2	1	0
Auto_FM	...	A[2]	A[1]	A[0]	C4	C3	C2	C1	S

Important: “S” = Bit[0] indicates correct NICAM-synchronization (S = 1). If S = 0, the MSP 3411/3451G has not yet synchronized correctly to frame and sequence, or has lost synchronization. The remaining read registers are therefore not valid. The MSP mutes the NICAM output automatically and tries to synchronize again as long as MODE_REG[6] is set.

The operation mode is coded by C4-C1 as shown in Table 6–16.

Table 6–16: NICAM operation modes as defined by the EBU NICAM 728 specification

C4	C3	C2	C1	Operation Mode
0	0	0	0	Stereo sound (NICAMA/B), independent mono sound (FM1)
0	0	0	1	Two independent mono signals (NICAMA, FM1)
0	0	1	0	Three independent mono channels (NICAMA, NICAMB, FM1)
0	0	1	1	Data transmission only; no audio
1	0	0	0	Stereo sound (NICAMA/B), FM1 carries same channel
1	0	0	1	One mono signal (NICAMA). FM1 carries same channel as NICAMA
1	0	1	0	Two independent mono channels (NICAMA, NICAMB). FM1 carries same channel as NICAMA
1	0	1	1	Data transmission only; no audio
x	1	x	x	Unimplemented sound coding option (not yet defined by EBU NICAM 728 specification)
AUTO_FM: monitor bit for the AUTO_FM Status: 0: NICAM source is NICAM 1: NICAM source is FM				

Note: It is no longer necessary to read out and evaluate the C_AD_BITS. All evaluation is performed in the MSP and indicated in the STATUS register.

6.4.2. Additional Data Bits Register

Contains the remaining 8 of the 11 additional data bits. The additional data bits are not yet defined by the NICAM 728 system.

Format:

MSB		ADD_BITS 00 38 _{hex}						LSB
7	6	5	4	3	2	1	0	
A[10]	A[9]	A[8]	A[7]	A[6]	A[5]	A[4]	A[3]	

6.4.3. CIB Bits Register

CIB bits 1 and 2 (see NICAM 728 specifications).

Format:

MSB		CIB_BITS 00 3E _{hex}						LSB
7	6	5	4	3	2	1	0	
x	x	x	x	x	x	CIB1	CIB2	

6.4.4. NICAM Error Rate Register

ERROR_RATE	00 57 _{hex}
Error free	0000 _{hex}
maximum error rate	07FF _{hex}

Average error rate of the NICAM reception in a time interval of 182 ms, which should be close to 0. The initial and maximum value of ERROR_RATE is 2047. This value is also active if the NICAM bit of MODE_REG is not set. Since the value is achieved by filtering, a certain transition time (approx. 0.5 sec) is unavoidable. Acceptable audio may have error rates up to a value of 700 int. Individual evaluation of this value by the controller and an appropriate threshold may define the fallback mode from NICAM to FM/AM-Mono in case of poor NICAM reception.

The bit error rate per second (BER) can be calculated by means of the following formula:

$$\text{BER} = \text{ERROR_RATE} * 12.3 * 10^{-6} / \text{s}$$

6.4.5. PLL_CAPS Readback Register

It is possible to read out the actual setting of the PLL_CAPS. In standard applications, this register is not of interest for the customer.

PLL_CAPS	02 1F _{hex} L
minimum frequency	1111 1111 FF _{hex}
nominal frequency	0101 0110 56 _{hex} RESET
maximum frequency	0000 0000 00 _{hex}
PLL_CAPS	02 1F _{hex} H
PLL open	xxxx xxx0
PLL closed	xxxx xxx1

6.4.6. AGC_GAIN Readback Register

It is possible to read out the actual setting of AGC_GAIN in Automatic Gain Mode. In standard applications, this register is not of interest for the customer.

AGC_GAIN	02 1E _{hex}
max. amplification (20 dB)	0001 0100 14 _{hex}
min. amplification (3 dB)	0000 0000 00 _{hex}

6.4.7. Automatic Search Function for FM-Carrier Detection in Satellite Mode

The AM demodulation ability of the MSP 34x1G offers the possibility to calculate the “field strength” of the momentarily selected FM carrier, which can be read out by the controller. In SAT receivers, this feature can be used to make automatic FM carrier search possible.

For this, the MSP has to be switched to AM-mode (MODE_REG[8]), FM-Prescale must be set to 7F_{hex} = +127_{dec}, and the FM DC notch (see section 6.5.7.) must be switched off. The sound-IF frequency range must now be “scanned” in the MSP-channel 2 by means of the programmable quadrature mixer with an appropriate incremental frequency (i.e. 10 kHz). After each incrementation, a field strength value is available at the quasi-peak detector output (quasi-peak detector source must be set to FM), which must be examined for relative maxima by the controller. This results in either continuing search or switching the MSP back to FM demodulation mode.

During the search process, the FIR2 must be loaded with the coefficient set “AUTOSEARCH”, which enables small bandwidth, resulting in appropriate field strength characteristics. The absolute field strength value (can be read out of “quasi-peak detector output FM1”) also gives information on whether a main FM carrier or a subcarrier was detected; and as a practical consequence, the FM bandwidth (FIR1/2) and the deemphasis (50 µs or adaptive) can be switched accordingly.

Due to the fact that a constant demodulation frequency offset of a few kHz leads to a DC level in the demodulated signal, further fine tuning of the found carrier can be achieved by evaluating the “DC Level Readout FM1”. Therefore, the FM DC Notch must be switched on, and the demodulator part must be switched back to FM-demodulation mode.

For a detailed description of the automatic search function, please refer to the corresponding MSP Windows software.

6.5. Manual/Compatibility Mode: Description of DSP Write Registers

6.5.1. Additional Channel Matrix Modes

Loudspeaker Matrix	00 08 _{hex}	L
Headphone Matrix	00 09 _{hex}	L
SCART1 Matrix	00 0A _{hex}	L
SCART2 Matrix	00 41 _{hex}	L
I ² S Matrix	00 0B _{hex}	L
Quasi-Peak Detector Matrix	00 0C _{hex}	L
SUM/DIFF	0100 0000	40 _{hex}
AB_XCHANGE	0101 0000	50 _{hex}
PHASE_CHANGE_B	0110 0000	60 _{hex}
PHASE_CHANGE_A	0111 0000	70 _{hex}
A_ONLY	1000 0000	80 _{hex}
B_ONLY	1001 0000	90 _{hex}

This table shows additional modes for the channel matrix registers.

The sum/difference mode can be used together with the quasi-peak detector to determine the sound material mode. If the difference signal on channel B (right) is near to zero, and the sum signal on channel A (left) is high, the incoming audio signal is mono. If there is a significant level on the difference signal, the incoming audio is stereo.

6.5.2. Volume Modes of SCART1/2 Outputs

Volume Mode SCART1	00 07 _{hex}	[3:0]
Volume Mode SCART2	00 40 _{hex}	[3:0]
linear	0000 RESET	0 _{hex}
logarithmic	0001	1 _{hex}

Linear Mode		
Volume SCART1	00 07 _{hex}	H
Volume SCART2	00 40 _{hex}	H
OFF	0000 0000 RESET	00 _{hex}
0 dB gain (digital full scale (FS) to 2 V _{RMS} output)	0100 0000	40 _{hex}
+6 dB gain (–6 dBFS to 2 V _{RMS} output)	0111 1111	7F _{hex}

Note: SCART Volume linear mode will not be supported in the future (documented for compatibility reasons only).

6.5.3. FM Fixed Deemphasis

FM Deemphasis	00 0F _{hex}	H
50 μ s	0000 0000 RESET	00 _{hex}
75 μ s	0000 0001	01 _{hex}
J17	0000 0100	04 _{hex}
OFF	0011 1111	3F _{hex}

Note: This register is initialized during STANDARD SELECTION and is automatically updated when Automatic Sound Select (MODUS[0]=1) is on.

6.5.4. FM Adaptive Deemphasis

FM Adaptive Deemphasis WP1	00 0F _{hex}	L
OFF	0000 0000 RESET	00 _{hex}
WP1	0011 1111	3F _{hex}

Note: This register is initialized during STANDARD SELECTION and is automatically updated when Automatic Sound Select (MODUS[0]=1) is on.

6.5.5. NICAM Deemphasis

A J17 Deemphasis is always applied to the NICAM signal. It is not switchable.

6.5.6. Identification Mode for A2 Stereo Systems

Identification Mode	00 15 _{hex}	L
Standard B/G (German Stereo)	0000 0000 RESET	00 _{hex}
Standard M (Korean Stereo)	0000 0001	01 _{hex}
Reset of Ident-Filter	0011 1111	3F _{hex}

To shorten the response time of the identification algorithm after a program change between two FM-Stereo capable programs, the reset of the ident-filter can be applied.

Sequence:

1. Program change
2. Reset ident-filter
3. Set identification mode back to standard B/G or M
4. Wait approx. 500 ms
5. Read stereo detection register

Note: This register is initialized during STANDARD SELECTION and is automatically updated when Automatic Sound Select (MODUS[0]=1) is on.

6.5.7. FM DC Notch

The DC compensation filter (FM DC Notch) for FM input can be switched off. This is used to speed up the automatic search function (see Section 6.4.7.). In normal FM-mode, the FM DC Notch should be switched on.

FM DC Notch	00 17 _{hex}	L
ON	0000 0000 Reset	00 _{hex}
OFF	0011 1111	3F _{hex}

6.6. Manual/Compatibility Mode: Description of DSP Read Registers

All readable registers are 16-bit wide. Transmissions via I²C bus have to take place in 16-bit words. Some of the defined 16-bit words are divided into low and high byte, thus holding two different control entities.

These registers are not writable.

6.6.1. Stereo Detection Register for A2 Stereo Systems

Stereo Detection Register	00 18 _{hex}	H
Stereo Mode	Reading (two's complement)	
MONO	near zero	
STEREO	positive value (ideal reception: 7F _{hex})	
BILINGUAL	negative value (ideal reception: 80 _{hex})	

Note: It is no longer necessary to read out and evaluate the A2 identification level. All evaluation is performed in the MSP and indicated in the STATUS register.

6.6.2. DC Level Register

DC Level Readout FM1 (MSP-Ch2)	00 1B _{hex}	H+L
DC Level Readout FM2 (MSP-Ch1)	00 1C _{hex}	H+L
DC Level	[8000 _{hex} ... 7FFF _{hex}] values are 16 bit two's complement	

The DC level register measures the DC component of the incoming FM signals (FM1 and FM2). This can be used for seek functions in satellite receivers and for IF FM frequencies fine tuning. A too low demodulation frequency (DCO) results in a positive DC-level and vice versa. For further processing, the DC content of the demodulated FM signals is suppressed. The time constant τ , defining the transition time of the DC Level Register, is approximately 28 ms.

6.7. Demodulator Source Channels in Manual Mode

6.7.1. Terrestrial Sound Standards

Table 6–17 shows the source channel assignment of the demodulated signals in case of manual mode for all terrestrial sound standards. See Table 2–2 for the assignment in the Automatic Sound Select mode. In manual mode for terrestrial sound standards, only two demodulator sources are defined.

6.7.2. SAT Sound Standards

Table 6–18 shows the source channel assignment of the demodulated signals for SAT sound standards.

Table 6–17: Manual Sound Select Mode for Terrestrial Sound Standards

				Source Channels of Sound Select Block	
Broadcasted Sound Standard	Selected MSP Standard Code	Broadcasted Sound Mode	FM Matrix	FM/AM (use 0 for channel select)	Stereo or A/B (use 1 for channel select)
B/G-FM D/K-FM M-Korea M-Japan	03 04, 05 02 30	MONO	Sound A Mono	Mono	Mono
		STEREO	German Stereo Korean Stereo	Stereo	Stereo
		BILINGUAL, Languages A and B	No Matrix	Left = A Right = B	Left = A Right = B
B/G-NICAM L-NICAM I-NICAM D/K-NICAM D/K-NICAM (with high deviation FM)	08 09 0A 0B 0C 0D	NICAM not available or NICAM error rate too high	Sound A Mono ¹⁾	analog Mono	no sound with AUTO_FM: analog Mono
		MONO	Sound A Mono ¹⁾	analog Mono	NICAM Mono
		STEREO	Sound A Mono ¹⁾	analog Mono	NICAM Stereo
		BILINGUAL, Languages A and B	Sound A Mono ¹⁾	analog Mono	Left = NICAM A Right = NICAM B
BTSC	20	MONO	Sound A Mono	Mono	Mono
		STEREO	Korean Stereo	Stereo	Stereo
		MONO + SAP	Sound A Mono	Mono	Mono
		STEREO + SAP	Korean Stereo	Stereo	Stereo
	21	MONO	Sound A Mono	Mono	Mono
		STEREO			
		MONO + SAP	No Matrix	Left = Mono Right = SAP	Left = Mono Right = SAP
		STEREO + SAP			
FM-Radio	40	MONO	Sound A Mono	Mono	Mono
		STEREO	Korean Stereo	Stereo	Stereo

¹⁾ Automatic refresh to Sound A Mono, do not write any other value to the register FM Matrix!

Table 6–18: Manual Sound Select Modes for SAT-Standards

				Source Channels of Sound Select Block for SAT-Modes			
Broadcasted Sound Standard	Selected MSP Standard Code	Broadcasted Sound Mode	FM Matrix	FM/AM (source select: 0)	Stereo or A/B (source select: 1)	Stereo or A (source select: 3)	Stereo or B (source select: 4)
FM SAT	6, 50 _{hex}	MONO	Sound A Mono	Mono	Mono	Mono	Mono
	51 _{hex}	STEREO	No Matrix	Stereo	Stereo	Stereo	Stereo
		BILINGUAL	No Matrix	Left = A (FM1) Right = B (FM2)	Left = A (FM1) Right = B (FM2)	A (FM1)	B (FM2)

6.8. Exclusions of Audio Baseband Features

In general, all functions can be switched independently. Two exceptions exist:

1. NICAM cannot be processed simultaneously with the FM2 channel.
2. FM adaptive deemphasis cannot be processed simultaneously with FM-identification.

6.9. Phase Relationship of Analog Outputs

The analog output signals: Loudspeaker, headphone, and SCART2 all have the same phases. The user does not need to correct output phases when using these analog outputs directly. The SCART1 output has opposite phase.

Using the I²S-outputs for other DSPs or D/A converters, care must be taken to adjust for the correct phase. If the attached coprocessor is one of the MSP family, the following schematics help to determine the phase relationship.

6.10. Compatibility Restrictions to MSP 34xxD

The MSP 34x1G is fully hardware compatible to the MSP 34xxD. However, to substitute a MSP 34xxD by the corresponding MSP 34x1G, the controller software has to be adapted slightly:

1. The register FM-Matrix (00 0E_{hex} low part) must be changed from “no matrix (00_{hex})” to “sound A mono (03_{hex})” during mono transmission of all TV-sound standards (see also Table 6–17).
2. With the MSP 34x1G, the STANDARD SELECTION initializes the FM-deemphasis, which is not the case for the MSP 34xxD. So, if STANDARD SELECTION is applied, this I²C instruction can be omitted.

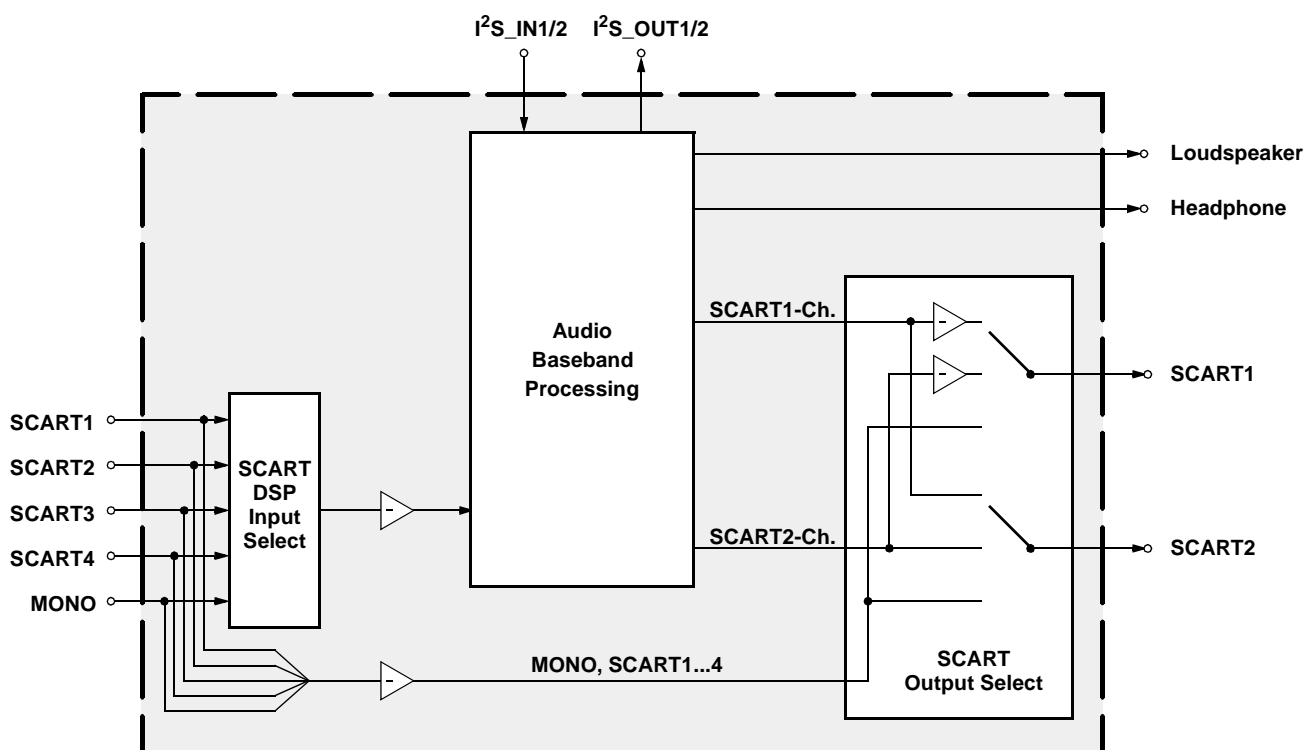

Fig. 6–2: Phase diagram of the MSP 34x1G

7. Appendix D: MSP 34x1G Version History

MSP 3451G-A1

First release

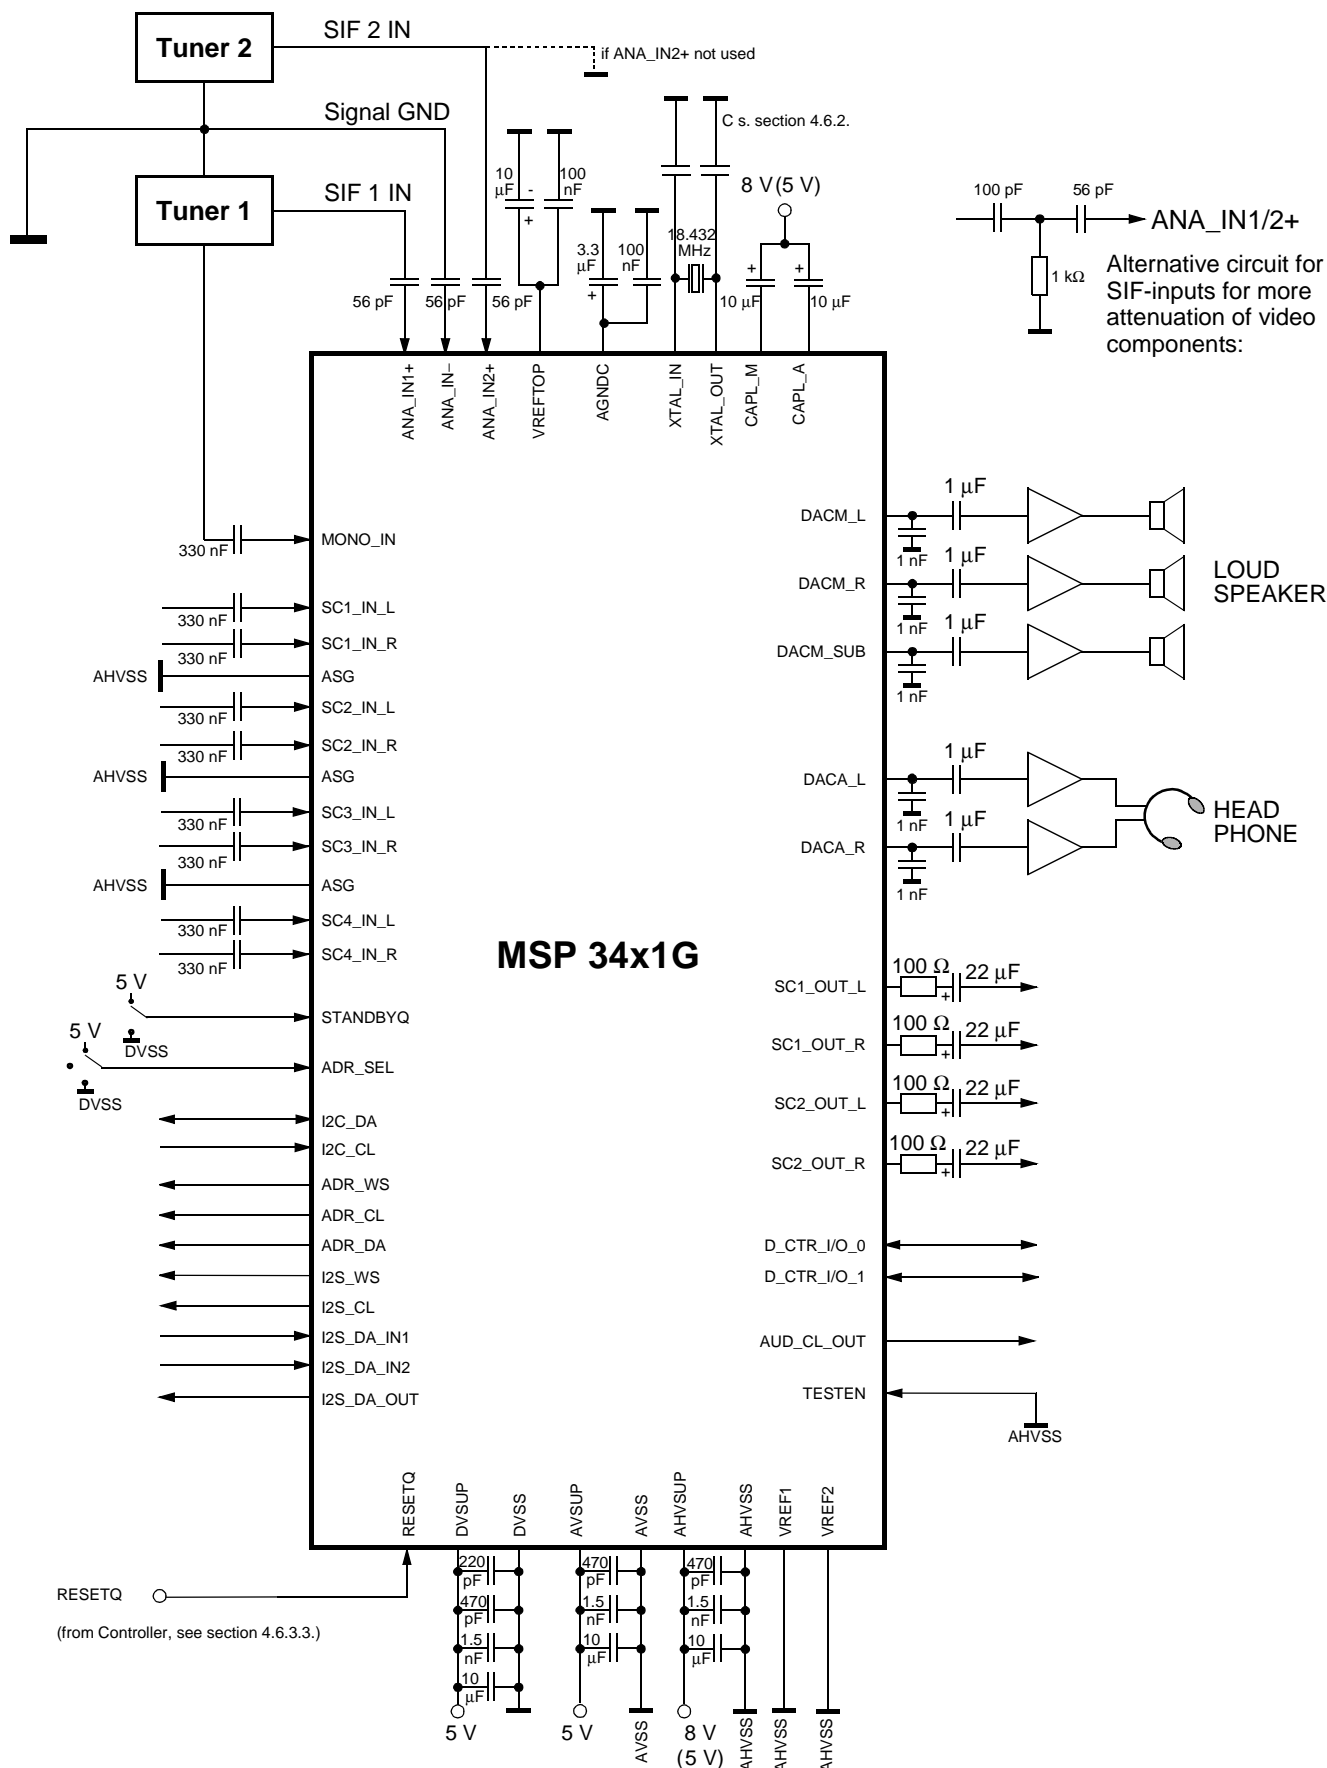

MSP 3451G-A2

- CONTROL register now readable for more status information
- new D/K standard for Poland
- improved I²C hardware problem handling
- improved AM-performance

MSP 34x1G-B8

- fine-tuning of A2-identification and carrier mute
- EIA-J identification: faster transition time stereo/bilingual to mono
- J17 FM-deemphasis implemented
- input specification for RESETQ and TESTEN changed
- MDB implemented

8. Appendix E: Application Circuit

9. Data Sheet History

1. Preliminary data sheet: "MSP 34x1G Multistandard Sound Processor Family with Virtual Dolby Surround", Edition Oct. 15, 1999, 6251-511-1PD. First release of the preliminary data sheet.

2. Preliminary data sheet: "MSP 34x1G Multistandard Sound Processor Family with Virtual Dolby Surround", March 5, 2001, 6251-511-2PD. Second release of the preliminary data sheet. Major changes:

- specification for version B8 added
(see Appendix D: Version History)
- MSP 3461 added, MSP 3431 removed
- description for MDB added
- specification for MNR added
