

- Low Supply Voltage Range 1.8 V – 3.6 V
- Ultralow-Power Consumption
Low Operation Current,
1.6 μ A at 4 kHz, 2.2 V
200 μ A at 1 MHz, 2.2 V
- Five Power Saving Modes:
(Standby Mode: 0.8 μ A,
RAM Retention Off Mode: 0.1 μ A)
- Wake-Up From Standby Mode in 6 μ s
- 16-Bit RISC Architecture, 125 ns Instruction Cycle Time
- Basic Clock Module Configurations:
 - Various Internal Resistors
 - Single External Resistor
 - 32 kHz Crystal
 - High Frequency Crystal
 - Resonator
 - External Clock Source
- 16-Bit Timer With Three Capture/Compare Registers
- Slope A/D Converter With External Components
- Serial Onboard Programming
- Family Members Include:
 - MSP430F110: 1KB + 128B Flash Memory
128B RAM
 - MSP430F112: 4KB + 256B Flash Memory
256B RAM
- Available in a 20-Pin Plastic Small-Outline Wide Body (SOWB) Package and 20-Pin Plastic Thin Shrink Small-Outline Package (TSSOP)

description

The Texas Instruments MSP430 series is an ultralow-power microcontroller family consisting of several devices featuring different sets of modules targeted to various applications. The microcontroller is designed to be battery operated for an extended application lifetime. With 16-bit RISC architecture, 16 bit integrated registers on the CPU, and the constant generator, the MSP430 achieves maximum code efficiency. The digitally-controlled oscillator provides fast wake-up from all low-power modes to active mode in less than 6 μ s.

Typical applications include sensor systems that capture analog signals, convert them to digital values, and then process the data and display them or transmit them to a host system. Stand alone RF sensor front end is another area of application. The I/O port inputs provide single slope A/D conversion capability on resistive sensors. The MSP430x11x series is an ultralow-power mixed signal microcontroller with a built in 16-bit timer and fourteen I/O pins. The MSP430x11x1 family adds a versatile analog comparator.

The flash memory provides added flexibility of in-system programming and data storage without significantly increasing the current consumption of the device. The programming voltage is generated on-chip, thereby alleviating the need for an additional supply, and even allowing for reprogramming of battery-operated systems.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

V _{SS}	4		Ground reference
XIN	6	I	Input terminal of crystal oscillator
XOUT/TCLK	5	I/O	Output terminal of crystal oscillator or test clock input

[†] TDO or TDI is selected via JTAG instruction.

short-form description

processing unit

The processing unit is based on a consistent, and orthogonally-designed CPU and instruction set. This design structure results in a RISC-like architecture, highly transparent to the application development, and noted for its programming simplicity. All operations other than program-flow instructions are consequently performed as register operations in conjunction with seven addressing modes for source and four modes for destination operands.

MSP430F11x MIXED SIGNAL MICROCONTROLLER

SLAS256B – NOVEMBER 1999 – REVISED JUNE 2000

short-form description (continued)

CPU

All sixteen registers are located inside the CPU, providing reduced instruction execution time. This reduces a register-register operation execution time to one cycle of the processor.

Four registers are reserved for special use as a program counter, a stack pointer, a status register, and a constant generator. The remaining twelve registers are available as general-purpose registers.

Peripherals are connected to the CPU using a data address and control buses and can be handled easily with all instructions for memory manipulation.

Program Counter	PC/R0
Stack Pointer	SP/R1
Status Register	SR/CG1/R2
Constant Generator	CG2/R3
General-Purpose Register	R4
General-Purpose Register	R5
⋮	
General-Purpose Register	R14
General-Purpose Register	R15

instruction set

The instructions set for this register-register architecture provides a powerful and easy-to-use assembly language. The instruction set consists of 51 instructions with three formats and seven addressing modes. Table 1 provides a summation and example of the three types of instruction formats; the addressing modes are listed in Table 2.

Table 1. Instruction Word Formats

Dual operands, source-destination	e.g. ADD R4, R5	$R4 + R5 \rightarrow R5$
Single operands, destination only	e.g. CALL R8	$PC \rightarrow (TOS), R8 \rightarrow PC$
Relative jump, un-/conditional	e.g. JNE	Jump-on equal bit = 0

Most instructions can operate on both word and byte data. Byte operations are identified by the suffix B.

Examples:	Instructions for word operation	Instructions for byte operation
	MOV EDE,TONI	MOV.B EDE,TONI
	ADD #235h,&MEM	ADD.B #35h,&MEM
	PUSH R5	PUSH.B R5
	SWPB R5	—

Table 2. Address Mode Descriptions

ADDRESS MODE	s	d	SYNTAX	EXAMPLE	OPERATION
Register	√	√	MOV Rs, Rd	MOV R10, R11	$R10 \rightarrow R11$
Indexed	√	√	MOV X(Rn), Y(Rm)	MOV 2(R5), 6(R6)	$M(2 + R5) \rightarrow M(6 + R6)$
Symbolic (PC relative)	√	√	MOV EDE, TONI		$M(EDE) \rightarrow M(TONI)$
Absolute	√	√	MOV &MEM, &TCDAT		$M(MEM) \rightarrow M(TCDAT)$
Indirect	√		MOV @Rn, Y(Rm)	MOV @R10, Tab(R6)	$M(R10) \rightarrow M(Tab + R6)$
Indirect autoincrement	√		MOV @Rn+, RM	MOV @R10+, R11	$M(R10) \rightarrow R11, R10 + 2 \rightarrow R10$
Immediate	√		MOV #X, TONI	MOV #45, TONI	$\#45 \rightarrow M(TONI)$

NOTE: s = source d = destination Rs/Rd = source register/destination register Rn = register number

POST OFFICE BOX 655303 • DALLAS, TEXAS 75265

instruction set (continued)

Computed branches (BR) and subroutine calls (CALL) instructions use the same addressing modes as the other instructions. These addressing modes provide *indirect* addressing, ideally suited for computed branches and calls. The full use of this programming capability permits a program structure different from conventional 8- and 16-bit controllers. For example, numerous routines can easily be designed to deal with pointers and stacks instead of using flag type programs for flow control.

operation modes and interrupts

The MSP430 operating modes support various advanced requirements for ultralow-power and ultralow energy consumption. This is achieved by the intelligent management of the operations during the different module operation modes and CPU states. The advanced requirements are fully supported during interrupt event handling. An interrupt event awakens the system from each of the various operating modes and returns with the *RETI* instruction to the mode that was selected before the interrupt event. The different requirements of the CPU and modules, which are driven by system cost and current consumption objectives, necessitate the use of different clock signals:

- Auxiliary clock ACLK (from LFXT1CLK/crystal's frequency), used by the peripheral modules
- Main system clock MCLK, used by the CPU and system
- Subsystem clock SMCLK, used by the peripheral modules

low-power consumption capabilities

The various operating modes are controlled by the software through the operation of the internal clock system. This clock system provides many combinations of hardware and software capabilities to run the application with the lowest power consumption and with optimized system costs:

- Use the internal clock (DCO) generator without any external components.
- Select an external crystal or ceramic resonator for lowest frequency or cost.
- Select and activate the proper clock signals (LFXT1CLK and/or DCOCLK) and clock pre-divider function.
- Apply an external clock source.

Four of the control bits that influence the operation of the clock system and support fast turnon from low power operating modes are located in the status register SR. The four bits that control the CPU and the system clock generator are SCG1, SCG0, OscOff, and CPUOff:

status register R2

15	9	8	7	6	5	4	3	2	1	0
Reserved For Future Enhancements	V	SCG1	SCG0	OscOff	CPUOff	GIE	N	Z	C	
rw-0	rw-0	rw-0	rw-0	rw-0	rw-0	rw-0	rw-0	rw-0	rw-0	rw-0

The bits CPUOff, SCG1, SCG0, and OscOff are the most important low-power control bits when the basic function of the system clock generator is established. They are pushed onto the stack whenever an interrupt is accepted and thereby saved so that the previous mode of operation can be retrieved after the interrupt request. During execution of an interrupt handler routine, the bits can be manipulated via indirect access of the data on the stack. That allows the program to resume execution in another power operating mode after the return from interrupt (RETI).

SCG1: The clock signal SMCLK, used for peripherals, is enabled when bit SCG1 is reset or disabled if the bit is set.

MSP430F11x

MIXED SIGNAL MICROCONTROLLER

SLAS256B – NOVEMBER 1999 – REVISED JUNE 2000

SCG0: The dc-generator is active when SCG0 is reset. The dc-generator can be deactivated only if the SCG0 bit is set and the DCOCLK signal is not used for MCLK or SMCLK. The current consumed by the dc-generator defines the basic frequency of the DCOCLK. It is a dc current.

The clock signal DCOCLK is deactivated if it is not used for MCLK or SMCLK or if the SCG0 bit is set. There are two situations when the SCG0 bit cannot switch off the DCOCLK signal:

1. DCOCLK frequency is used for MCLK (CPUOff=0 and SELM.1=0).
2. DCOCLK frequency is used for SMCLK (SCG1=0 and SELS=0).

NOTE:

When the current is switched off (SCG0=1) the start of the DCOCLK is delayed slightly. The delay is in the μ s-range (see device parameters for details).

OscOff: The LFXT1 crystal oscillator is active when the OscOff bit is reset. The LFXT1 oscillator can only be deactivated if the OscOff bit is set and it is not used for MCLK or SMCLK. The setup time to start a crystal oscillation needs consideration when the oscillator off option is used. Mask programmable (ROM) devices can disable this feature so that the oscillator can never be switched off by software.

CPUOff: The clock signal MCLK, used for the CPU, is active when the CPUOff bit is reset or stopped if it is set.

interrupt vector addresses

The interrupt vectors and the power-up starting address are located in the memory with an address range of 0FFFFh-0FFE0h. The vector contains the 16-bit address of the appropriate interrupt handler instruction sequence.

INTERRUPT SOURCE	INTERRUPT FLAG	SYSTEM INTERRUPT	WORD ADDRESS	PRIORITY
Power-up, external reset, watchdog	WDTIFG (Note1) KEYV (Note 1)	Reset	0FFFEh	15, highest
NMI, oscillator fault, flash memory access violation	NMIIFG (Notes 1 and 5) OFIFG (Notes 1 and 5) ACCVIFG (Notes 1 and 5)	(non)-maskable, (non)-maskable, (non)-maskable	0FFFCh	14
			0FFFAh	13
			0FFF8h	12
			0FFF6h	11
Watchdog timer	WDTIFG	maskable	0FFF4h	10
Timer_A	CCIFG0 (Note 2)	maskable	0FFF2h	9
Timer_A	CCIFG1, CCIFG2, TAIFG (Notes 1 and 2)	maskable	0FFF0h	8
			0FFEEh	7
			0FFECCh	6
			0FFEAh	5
			0FFE8h	4
I/O Port P2 (eight flags – see Note 3)	P2IFG.0 to P2IFG.7 (Notes 1 and 2)	maskable	0FFE6h	3
I/O Port P1 (eight flags)	P1IFG.0 to P1IFG.7 (Notes 1 and 2)	maskable	0FFE4h	2
			0FFE2h	1
			0FFE0h	0, lowest

- NOTES:
1. Multiple source flags
 2. Interrupt flags are located in the module
 3. There are eight Port P2 interrupt flags, but only six Port P2 I/O pins (P2.0–5) are implemented on the 11x devices.
 4. Nonmaskable: neither the individual nor the general interrupt enable bit will disable an interrupt event.
 5. (non)-maskable: the individual interrupt enable bit can disable an interrupt event, but the general interrupt enable cannot.

POST OFFICE BOX 655303 • DALLAS, TEXAS 75265

special function registers

Most interrupt and module enable bits are collected into the lowest address space. Special function register bits that are not allocated to a functional purpose are not physically present in the device. Simple software access is provided with this arrangement.

interrupt enable 1 and 2

Address	7	6	5	4	3	2	1	0
0h			ACCIE	NMIE			OFIE	WDIE
			rw-0	rw-0			rw-0	rw-0

WDIE: Watchdog timer enable signal
 OFIE: Oscillator fault enable signal
 NMIE: Nonmaskable interrupt enable signal
 ACCIE: Access violation at flash memory

Address	7	6	5	4	3	2	1	0
01h								

interrupt flag register 1 and 2

Address	7	6	5	4	3	2	1	0
02h				NMIFG			OFIFG	WDIFG
				rw-0			rw-1	rw-0

WDIFG: Set on overflow or security key violation or
 Reset on V_{CC} power-on or reset condition at $\overline{RST}/NMI$ -pin
 OFIFG: Flag set on oscillator fault
 NMIFG: Set via $\overline{RST}/NMI$ -pin

Address	7	6	5	4	3	2	1	0
03h								

Legend **rw:** Bit can be read and written.
 rw-0: Bit can be read and written. It is reset by PUC.
 SFR bit is not present in device.

boot ROM containing bootstrap loader

The intention of the bootstrap loader is to download data into the flash memory module. Various write, read, and erase operations are needed for a proper download environment. The bootstrap loader is only available on F devices.

functions of the bootstrap loader:

Definition of read: apply and transmit data of peripheral registers or memory to pin P1.1 (BSLTX)
write: read data from pin P2.2 (BSLRX) and write them into flash memory

unprotected functions

Mass erase, erase of the main memory (Segment0 to Segment7)

Access to the MSP430 via the bootstrap loader is protected. It must be enabled before any protected function can be performed. The 256 bits in 0FFE0h to 0FFFFh provide the access key.

protected functions

All protected functions can be executed only if the access is enabled.

- Write/program byte into flash memory; parameters passed are start address and number of bytes (the segment-write feature of the flash memory is not supported and not useful with the UART protocol).
- Segment erase of Segment0 to Segment7 in the main memory and segment erase of SegmentA and SegmentB in the information memory.
- Read all data in main memory and information memory.
- Read and write to all byte-peripheral modules and RAM.
- Modify PC and start program execution immediately.

NOTE:

Unauthorized readout of code and data is prevented by the user's definition of the data in the interrupt memory locations.

boot ROM containing bootstrap loader (continued)

features of the bootstrap loader are:

- UART communication protocol, fixed to 9600 baud
- Port pin P1.1 for transmit, P2.2 for receive
- TI standard serial protocol definition
- Implemented in flash memory version only
- Program execution starts with the user vector at 0FFFFh or with the bootstrap loader (start vector is at address 0C00h)

hardware resources used for serial input/output:

- Pins P1.1 and P2.2 for serial data transmission
- Test and $\overline{\text{RST}}/\text{NMI}$ to start program execution at the reset or bootstrap loader vector
- Basic clock module: Rsel=5, DCO=4, MOD=0, DCOCLK for MCLK and SMCLK, clock divider for MCLK and SMCLK at default: dividing by 1
- Timer_A: Timer_A operates in continuous mode with MCLK source selected, input divider set to 1, using CCR0, and polling of CCIFG0.
- WDT: Watchdog timer is halted
- Interrupt: GIE=0, NMIIIE=0, OFIFG=0, ACCVIFG=0
- Memory allocation and stack pointer:
If the stack pointer points to RAM addresses above 0220h, 6 bytes of the stack are allocated plus RAM addresses 0200h to 0219h. Otherwise the stack pointer is set to 0220h and allocates RAM from 0200h to 021Fh.

NOTE:

When writing RAM data via bootstrap loader, make sure that the stack is outside the range of the data being written.

Program execution begins with the user's reset vector at FFFEh (standard method) if TEST is held low while $\overline{\text{RST}}/\text{NMI}$ goes from low to high:

MSP430F11x

MIXED SIGNAL MICROCONTROLLER

SLAS256B – NOVEMBER 1999 – REVISED JUNE 2000

boot ROM containing bootstrap loader (continued)

Program execution begins with the bootstrap vector at 0C00h (boot ROM) if a minimum of two positive edges have been applied to TEST while $\overline{\text{RST}}/\text{NMI}$ is low, and TEST is high when $\overline{\text{RST}}/\text{NMI}$ goes from low to high. The TEST signal is normally used internally to switch pins P1.4, P1.5, P1.6, and P1.7 between their application function and the JTAG function. If the second rising edge at TEST is applied while $\overline{\text{RST}}/\text{NMI}$ is held low, the internal TEST signal is held low and the pins remain in the application mode:

Test mode can be entered again after TEST is taken low and then back high.

The bootstrap loader will not be started (via the vector in address 0C00h), if:

- There were less than two positive edges at TEST while $\overline{\text{RST}}/\text{NMI}$ is low
- TEST is low if $\overline{\text{RST}}/\text{NMI}$ goes from low to high
- JTAG has control over the MSP430 resources
- Supply voltage V_{CC} drops and a POR is executed

WARNING:

The bootstrap loader starts correctly only if the $\overline{\text{RST}}/\text{NMI}$ pin is in reset mode. If it is switched to the NMI function, unpredictable program execution may result. However, a bootstrap-load may be started using software and the bootstrap vector, for example the instruction BR &0C00h.

flash memory

The flash memory consists of 512-byte segments in the main memory and 128-byte segments in the information memory. See device memory maps for specific device information.

Segment0 to Segment7 can be erased individually, or altogether as a group.

SegmentA and SegmentB can be erased individually, or as a group with segments 0–7.

The memory in SegmentA and SegmentB is also called *Information Memory*.

V_{PP} is generated internally. V_{CC} current increases during programming.

During program/erase cycles, V_{CC} must not drop below the minimum specified for program/erase operation.

Program and erase timings are controlled by the flash timing generator—no software intervention is needed. The input frequency of the flash timing generator should be in the proper range and must be applied until the write/program or erase operation is completed.

During program or erase, no code can be executed from flash memory and all interrupts must be disabled by setting the GIE, NMIE, ACCVIE, and OFIE bits to zero. If a user program requires execution concurrent with a flash program or erase operation, the program must be executed from memory other than the flash memory (e.g., boot ROM, RAM). In the event a flash program or erase operation is initiated while the program counter is pointing to the flash memory, the CPU will execute JMP \$ instructions until the flash program or erase operation is completed. Normal execution of the previously running software then resumes.

Unprogrammed, new devices may have some bytes programmed in the information memory (needed for test during manufacturing). The user should perform an erase of the information memory prior to first use.

flash memory control register FCTL1

All control bits are reset during PUC. PUC is active after V_{CC} is applied, a reset condition is applied to the RST/NMI pin, the watchdog timer expires, a watchdog access violation occurs, or an improper flash operation has been performed. A more detailed description of the control-bit functions is found in the flash memory module description (refer to *MSP430x1xx User's Guide*, literature number SLAU049). Any write to control register FCTL1 during erase, mass erase, or write (programming) will end in an access violation with ACCVIFG=1. Special conditions apply for segment-write mode. Refer to *MSP430x1xx User's Guide*, literature number SLAU049 for details.

NOTE: All segments not implemented on all devices.

MSP430F11x MIXED SIGNAL MICROCONTROLLER

SLAS256B – NOVEMBER 1999 – REVISED JUNE 2000

flash memory control register FCTL1 (continued)

Read access is possible at any time without restrictions.

The control bits of control register FCTL1 are:

Table 3. Allowed Combinations of Control Bits Allowed for Flash Memory Access

FUNCTION PERFORMED	SEGWRT	WRT	MEras	Erase	BUSY	WAIT	Lock
Write word or byte	0	1	0	0	0	0	0
Write word or byte in same segment, segment write mode	1	1	0	0	0 → 1	0 → 1	0
Erase one segment by writing to any address in the target segment	0	0	0	1	0	0	0
Erase all segments (0 to 7) but not the information memory (segments A and B)	0	0	1	0	0	0	0
Erase all segments (0 to 7 and A and B) by writing to any address in the flash memory module	0	0	1	1	0	0	0

NOTE: The table shows all valid combinations. Any other combination will result in an access violation.

flash memory, timing generator, control register FCTL2

The timing generator (Figure 1) generates all the timing signals necessary for write, erase, and mass erase from the selected clock source. One of three different clock sources may be selected by control bits SSEL0 and SSEL1 in control register FCTL2. The selected clock source should be divided to meet the frequency requirements specified in the recommended operating conditions.

POST OFFICE BOX 655303 • DALLAS, TEXAS 75265

Read access is possible at any time without restrictions.

MSP430F11x

MIXED SIGNAL MICROCONTROLLER

SLAS256B – NOVEMBER 1999 – REVISED JUNE 2000

flash memory control register FCTL3 (continued)

BUSY	012Ch, bit0,	The BUSY bit shows if an access to the flash memory is allowed (BUSY=0), or if an access violation occurs. The BUSY bit is read-only, but a write operation is allowed. The BUSY bit should be tested before each write and erase cycle. The flash timing-generator hardware immediately sets the BUSY bit after start of a write, segment-write, erase, or <i>mass</i> erase operation. If the timing generator has completed the operation, the BUSY bit is reset by the hardware. No program code can be executed from the <i>busy</i> flash memory during the entire program or erase cycle. 0: Flash memory is not busy. 1: Flash memory is busy, and remains in busy state if segment write function is in <i>wait</i> mode.
KEYV,	012Ch, bit1	Key violation 0: Key 0A5h (high byte) was not violated. 1: Key 0A5h (high byte) was violated. Violation occurs when a write access to registers FCTL1, FCTL2, or FCTL3 is executed and the <i>high byte</i> is not equal to 0A5h. If the security key is violated, bit KEYV is set and a PUC is performed.
ACCVIFG,	012Ch, bit2	Access violation interrupt flag The access-violation flag is set when any combination of control bits other than those shown in Table 3 is attempted, or an instruction is fetched while a segment-write operation is active. Reading the control registers will not set the ACCVIFG bit. NOTE: The respective interrupt-enable bit ACCVIE is located in the interrupt enable register IE1 in the special function register. The software can set the ACCVIFG bit. If set by software, an NMI is also executed.
WAIT,	012CH, bit3	In the segment-write mode, the WAIT bit indicates that data has been written and the flash memory is prepared to receive the next data for programming. The WAIT bit is read only, but a write to the WAIT bit is allowed. 0: The segment-write operation has began and programming is in progress. 1: The segment-write operation is active and data programming is complete.

flash memory control register FCTL3 (continued)

LOCK	012Ch, bit4,	The lock bit may be set during any write, segment-erase, or <i>mass</i>-erase request. Any active sequence in progress is completed normally. In segment-write mode, the SEGWRT bit is reset and the WAIT bit is set after the mode ends. The lock bit is controlled by software or hardware. If an access violation occurs and the ACCVIFG is set, the LOCK bit is set automatically. 0: Flash memory may be read, programmed, erased, or <i>mass</i> erased. 1: Flash memory may be read but not programmed, erased, or <i>mass</i> erased. A current program, erase, or <i>mass</i>-erase operation will complete normally. The access-violation interrupt flag ACCVIFG is set when data are written to the flash memory module while the lock bit is set.
EMEX,	012Ch, bit5,	Emergency exit. The emergency exit should only be used if the flash memory write or erase operation is out of control. 0: No function 1: Stops the active operation immediately, and shuts down all internal parts in the flash memory controller. Current consumption immediately drops back to the active mode. All bits in control register FCTL1 are reset. Since the EMEX bit is automatically reset by hardware, the software always reads EMEX as 0.

flash memory, interrupt and security key violation

One NMI vector is used for three NMI events: $\overline{\text{RST}}$ /NMI (NMIIFG), oscillator fault (OFIFG), and flash-memory access violation (ACCVIFG). The software can determine the source of the interrupt request since all flags remain set until they are reset by software. The enable flag(s) should be set simultaneously with one instruction before the return-from-interrupt RETI instruction. This ensures that the stack remains under control. A pending NMI interrupt request will not increase stack demand unnecessarily.

Figure 2. Block Diagram of NMI Interrupt Sources

peripherals

Peripherals are connected to the CPU through data, address, and control buses, and they can be handled easily with memory manipulation instructions.

oscillator and system clock

Three clocks are used in the system—the system (master) clock MCLK, the subsystem (master) clock SMCLK, and the auxiliary clock ACLK:

- Main system clock MCLK, used by the CPU and the system

- Subsystem clock SMCLK, used by the peripheral modules

- Auxiliary clock ACLK, originated by LFXT1CLK (crystal frequency) and used by the peripheral modules

After a POR, the DCOCLK is used by default, the DCOR bit is reset, and the DCO is set to the nominal initial frequency. Additionally, if LFXT1CLK fails as the source for MCLK, the DCOCLK is automatically selected to ensure fail-safe operation.

SMCLK can be generated from LFXT1CLK or DCOCLK. ACLK is always generated from LFXT1CLK.

The crystal oscillator can be defined to operate with watch crystals (32768 Hz) or with higher-frequency ceramic resonators or crystals. The crystal or ceramic resonator is connected across two terminals. No external components are required for watch-crystal operation. If the high frequency XT1 mode is selected, external capacitors from XIN to V_{SS} and XOUT to V_{SS} are required as specified by the crystal manufacturer.

The LFXT1 oscillator starts after applying V_{CC} . If the OscOff bit is set to 1, the oscillator stops when it is not used for MCLK. The clock signals ACLK and SMCLK may be used externally via port pins.

Different application requirements and system conditions dictate different system clock requirements, including:

- High frequency for quick reaction to system hardware requests or events

- Low frequency to minimize current consumption, EMI, etc.

- Stable peripheral clock for timer applications, such as real-time clock (RTC)

- Start-stop operation to be enabled with minimum delay

MSP430F11x MIXED SIGNAL MICROCONTROLLER

SLAS256B – NOVEMBER 1999 – REVISED JUNE 2000

oscillator and system clock (continued)

Figure 3. Clock Signals

Two clock sources, LFXT1CLK and DCOCLK, can be used to drive the MSP430 system. The LFXT1CLK is generated from the LFXT1 crystal oscillator. The LFXT1 crystal oscillator can operate in three modes—low frequency (LF), moderate frequency (XT1), and external input mode. The LFXT1 crystal oscillator may be switched off when it is not in use.

DCOCLK is generated from the DCO. The nominal DCO frequency is defined by the dc generator and can be set by one external resistor, or can be set to one of eight values with integrated resistors. Additional adjustments and modulations of DCOCLK are possible by software manipulation of registers in the DCO module. DCOCLK is stopped automatically when it is not used by the CPU or peripheral modules. The dc generator can be shut down with the SCG0 bit to realize additional power savings when DCOCLK is not in use.

NOTE:

The system clock generator always starts with the DCOCLK selected for MCLK (CPU clock) to ensure proper start of program execution. The software defines the final system clock generation through control bit manipulation.

digital I/O

There are two eight-bit I/O ports, port P1 and port P2 – implemented (11x parts only have six port P2 I/O signals available on external pins). Both ports, P1 and P2, have seven control registers to give maximum flexibility of digital input/output to the application:

- All individual I/O bits are programmable independently.
- Any combination of input, output, and interrupt conditions is possible.
- Interrupt processing of external events is fully implemented for all eight bits of port P1 and for six bits of port P2.
- Read/write access to all registers with all instructions

digital I/O (continued)

The seven registers are:

- Input register 8 bits at port P1/P2 contains information at the pins
- Output register 8 bits at port P1/P2 contains output information
- Direction register 8 bits at port P1/P2 controls direction
- Interrupt edge select 8 bits at port P1/P2 input signal change necessary for interrupt
- Interrupt flags 8 bits at port P1/P2 indicates if interrupt(s) are pending
- Interrupt enable 8 bits at port P1/P2 contains interrupt enable bits
- Selection (Port or Mod.) 8 bits at port P1/P2 determines if pin(s) have port or module function

All these registers contain eight bits. Two interrupt vectors are implemented: one commonly used for any interrupt event on ports P1.0 to P1.7, and one commonly used for any interrupt event on ports P2.0 to P2.7.

NOTE:

Six bits of port P2, P2.0 to P2.5, are available on external pins – but all control and data bits for port P2 are implemented.

Watchdog Timer

The primary function of the watchdog timer (WDT) module is to perform a controlled system restart after a software problem has occurred. If the selected time interval expires, a system reset is generated. If this watchdog function is not needed in an application, the module can work as an interval timer, which generates an interrupt after the selected time interval.

The watchdog timer counter (WDTCNT) is a 16-bit up-counter which is not directly accessible by software. The WDTCNT is controlled through the watchdog timer control register (WDTCTL), which is a 16-bit read/write register. Writing to WDTCTL is, in both operating modes (watchdog or timer), only possible by using the correct password in the high-byte. The low-byte stores data written to the WDTCTL. The high-byte must be the password 05Ah. If any value other than 05Ah is written to the high-byte of the WDTCTL, a system reset PUC is generated. When the password is read, its value is 069h. This minimizes accidental write operations to the WDTCTL register. In addition to the watchdog timer control bits, there are two bits included in the WDTCTL register that configure the NMI pin.

Timer_A (Three capture/compare registers)

The Timer_A module on 11x devices offers one sixteen bit counter and three capture/compare registers. The timer clock source can be selected to come from two external sources TACLK (SSEL=0) or INCLK (SSEL=3), or from two internal sources, the ACLK (SSEL=1) or SMCLK (SSEL=2). The clock source can be divided by one, two, four, or eight. The timer can be fully controlled (in word mode) since it can be halted, read, and written. It can be stopped, run continuously, counted up or up/down, using one compare block to determine the period. The three capture/compare blocks are configured by the application to run in capture or compare mode.

The capture mode is primarily used to measure external or internal events using any combination of positive, negative, or both edges of the signal. Capture mode can be started and stopped by software. Three different external events TA0, TA1, and TA2 can be selected. At capture/compare register CCR2 the ACLK is the capture signal if CCI2B is selected. Software capture is chosen if CCISx=2 or CCISx=3 (see Figure 4).

The compare mode is primarily used to generate timings for the software or application hardware, or to generate pulse-width modulated output signals for various purposes like D/A conversion functions or motor control. An individual output module is assigned to each of the three capture/compare registers. The output modules can run independently of the compare function, or can be triggered in several ways.

MSP430F11x MIXED SIGNAL MICROCONTROLLER

SLAS256B – NOVEMBER 1999 – REVISED JUNE 2000

Timer_A (3 capture/compare registers) (continued)

Figure 4. Timer_A, MSP430x11x Configuration

Two interrupt vectors are used by the Timer_A module. One individual vector is assigned to capture/compare block CCR0, and one common interrupt vector is implemented for the timer and the other two capture/compare blocks. The three interrupt events using the same vector are identified by an individual interrupt vector word. The interrupt vector word is used to add an offset to the program counter to continue the interrupt handler software at the corresponding program location. This simplifies the interrupt handler and gives each interrupt event the same overhead of 5 cycles in the interrupt handler.

UART

Serial communication is implemented by using software and one capture/compare block. The hardware supports the output of the serial-data stream, bit by bit, with the timing determined by the comparator/timer. The data input uses the capture feature. The capture flag finds the start of a character, while the compare feature latches the input-data stream, bit by bit. The software/hardware interface connects the mixed-signal controller to external devices, systems, or networks.

MIXED SIGNAL MICROCONTROLLER

SLAS256B – NOVEMBER 1999 – REVISED JUNE 2000

absolute maximum ratings[†]

Voltage applied at V_{CC} to V_{SS}	–0.3 V to 4.1 V
Voltage applied to any pin (referenced to V_{SS})	–0.3 V to $V_{CC}+0.3$ V
Diode current at any device terminal	±2 mA
Storage temperature, T_{stg} (unprogrammed device)	–55°C to 150°C
Storage temperature, T_{stg} (programmed device)	–40°C to 85°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE: All voltages referenced to V_{SS} .

recommended operating conditions

			MIN	NOM	MAX	UNITS
Supply voltage during program execution, V _{CC} (see Note 6)			1.8		3.6	V
Supply voltage during program/erase flash memory, V _{CC}			2.7		3.6	V
Supply voltage, V _{SS}			0			V
Operating free-air temperature range, T _A			−40		85	°C
LFXT1 crystal frequency, f _(LFXT1) (see Note 7)	LF mode selected, XTS=0	Watch crystal	32 768			Hz
	XT1 mode selected, XTS=1	Ceramic resonator	450		8000	kHz
		Crystal	1000		8000	
Processor frequency f _(system) (MCLK signal)		V _{CC} = 1.8 V	dc		2	MHz
		V _{CC} = 2.2 V	dc		5	MHz
		V _{CC} = 3.6 V	dc		8	MHz
Flash timing generator frequency, f _(FTG)			257		476	kHz
Cumulative program time, segment write, t _(CPT) (see Note 8)		V _{CC} = 2.7 V/3.6 V			3	ms
Low-level input voltage (TCK, TMS, TDI, $\overline{\text{RST}}/\text{NMI}$), V _{IL} (excluding XIN, XOUT)		V _{CC} = 2.2 V/3 V	V _{SS}		V _{SS} +0.6	V
High-level input voltage (TCK, TMS, TDI, $\overline{\text{RST}}/\text{NMI}$), V _{IH} (excluding XIN, XOUT)		V _{CC} = 2.2 V/3 V	0.8V _{CC}		V _{CC}	V
Input levels at XIN, XOUT	V _{IL} (XIN, XOUT)	V _{CC} = 2.2 V/3 V	V _{SS}		0.2×V _{CC}	V
	V _{IH} (XIN, XOUT)		0.8×V _{CC}		V _{CC}	

NOTES: 6. The LFXT1 oscillator in LF-mode requires a resistor of 5.1 M Ω from XOUT to V_{SS} when $V_{CC} < 2.5$ V.

The LFXT1 oscillator in XT1-mode accepts a ceramic resonator or a crystal frequency of 4 MHz at $V_{CC} \geq 2.2$ V.

The LFXT1 oscillator in XT1-mode accepts a ceramic resonator or a crystal frequency of 8 MHz at $V_{CC} \geq 2.8$ V.

7. The LFXT1 oscillator in LF-mode requires a watch crystal.

The LFXT1 oscillator in XT1-mode accepts a ceramic resonator or a crystal.

8. The cumulative program time must not be exceeded during a segment-write operation.

recommended operating conditions (continued)

NOTE: Minimum processor frequency is defined by system clock. Flash program or erase operations require a minimum V_{CC} of 2.7 V.

NOTE 19: These parameters are not production tested.

Figure 8. DCO Characteristics

electrical characteristics over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted) (continued)

principle characteristics of the DCO

- Individual devices have a minimum and maximum operation frequency. The specified parameters for f_{DCOx0} to f_{DCOx7} are valid for all devices.
- The DCO control bits DCO0, DCO1 and DCO2 have a step size as defined in parameter S_{DCO} .
- The modulation control bits MOD0 to MOD4 select how often f_{DCO+1} is used within the period of 32 DCOCLK cycles. f_{DCO} is used for the remaining cycles. The frequency is an average = $f_{DCO} \times (2^{MOD/32})$.
- The ranges selected by R_{Sel4} to R_{Sel5} , R_{Sel5} to R_{Sel6} , and R_{Sel6} to R_{Sel7} are overlapping.

wake-up from lower power modes (LPMx)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t(LPM0)	Delay time (see Note 20)	V _{CC} = 2.2 V/3 V		100		ns
t(LPM2)		V _{CC} = 2.2 V/3 V		100		
t(LPM3)		f _(MCLK) = 1 MHz, V _{CC} = 2.2 V/3 V			6	μs
		f _(MCLK) = 2 MHz, V _{CC} = 2.2 V/3 V			6	
		f _(MCLK) = 3 MHz, V _{CC} = 2.2 V/3 V			6	
t(LPM4)		f _(MCLK) = 1 MHz, V _{CC} = 2.2 V/3 V			6	μs
		f _(MCLK) = 2 MHz, V _{CC} = 2.2 V/3 V			6	
		f _(MCLK) = 3 MHz, V _{CC} = 2.2 V/3 V			6	

NOTE 20: Parameter applicable only if DCOCLK is used for MCLK.

JTAG/programming

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$f_{(TCK)}$	TCK frequency, JTAG/test (see Note 21)	$V_{CC} = 2.2 \text{ V}$		dc	MHz
		$V_{CC} = 3 \text{ V}$		dc	
$I_{(DD-PGM)}$	Current during program cycle (see Note 22)	$V_{CC} = 2.7 \text{ V/3.6 V}$		3	mA
$I_{(DD-ERASE)}$	Current during erase cycle (see Note 22)	$V_{CC} = 2.7 \text{ V/3.6 V}$		3	mA
$t_{(retention)}$	Write/erase cycles	10^4	10^5		
	Data retention $T_A = 25^\circ\text{C}$	100			Year

NOTES: 21. $f_{(TCK)}$ may be restricted to meet the timing requirements of the module selected.

22. Duration of the program/erase cycle is determined by $f_{(FTG)}$ applied to the flash timing controller. It can be calculated as follows:

$$\begin{aligned}
 t_{(\text{word write})} &= 35 \times 1/f_{(FTG)} \\
 t_{(\text{segment write, byte 0})} &= 30 \times 1/f_{(FTG)} \\
 t_{(\text{segment write, byte 1 - 63})} &= 20 \times 1/f_{(FTG)} \\
 t_{(\text{mass erase})} &= 5297 \times 1/f_{(FTG)} \\
 t_{(\text{page erase})} &= 4819 \times 1/f_{(FTG)}
 \end{aligned}$$

[†] Signal from or to Timer_A

Port P2, P2.5, input/output with Schmitt-trigger and R_{OSC} function for the Basic Clock module

PnSel.x	PnDIR.x	Direction control from module	PnOUT.x	Module X OUT	PnIN.x	Module X IN	PnIE.x	PnIFG.x	PnIES.x
P2Sel.5	P2DIR.5	P2DIR.5	P2OUT.5	VSS	P2IN.5	unused	P2IE.5	P2IFG.5	P2IES.5

APPLICATION INFORMATION

Port P2, unbonded bits P2.6 and P2.7

P2Sel.x	P2DIR.x	Direction control from module	P2OUT.x	Module X OUT	P2IN.x	Module X IN	P2IE.x	P2IFG.x	P2IES.x
P2Sel.6	P2DIR.6	P2DIR.6	P2OUT.6	VSS	P2IN.6	unused	P2IE.6	P2IFG.6	P2IES.6
P2Sel.7	P2DIR.7	P2DIR.7	P2OUT.7	VSS	P2IN.7	unused	P2IE.7	P2IFG.7	P2IES.7

NOTE: A good use of the unbonded bits 6 and 7 of port P2 is to use the interrupt flags. The interrupt flags can not be influenced from any signal other than from software. They work then as a soft interrupt.

JTAG fuse check mode

MSP430 devices that have the fuse on the TEST terminal have a fuse check mode that tests the continuity of the fuse the first time the JTAG port is accessed after a power-on reset (POR). When activated, a fuse check current can flow from the TEST pin to ground if the fuse is not burned. Care must be taken to avoid accidentally activating the fuse check mode and increasing overall system power consumption.

When the TEST pin is taken back low after a test or programming session, the fuse check mode and sense currents are terminated.

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgment, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

Customers are responsible for their applications using TI components.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
