**PHILIPS**

# One page Economy Teletext/TV microcontroller

**SAA5290**

## FEATURES

### General

- Complete one page teletext decoder and TV microcontroller in a single 52-pin package
- Eastern European, Western European and Turkish language variants covered in one device
- Double size, double width and double height character capability for On-Screen Display (OSD)
- Enhanced display features including meshing and shadowing
- Separate display and acquisition timing for increased flexibility
- Minimum peripheral component count
- 525 line and 625 line display synchronization
- Standby mode through power-down of teletext and analog hardware.

### Microcontroller

- 16 kbytes masked ROM (16 kbytes EEPROM variant for product development)
- 256 bytes of on-chip RAM
- Six 6-bit Pulse Width Modulators (PWM) and one 14-bit precision PWM
- 4-bit Digital-to-Analog Converter (DAC) and comparator with a 3-input multiplexer allowing implementation of 3 Analog-to-Digital Converters (ADC) in software
- 2 high current (10 mA) open-drain outputs
- Interrupt logic 0 triggered on rising and falling edges, providing pulse-width measurement for remote control decoding
- Master and slave bit-level I<sup>2</sup>C-bus hardware.

## DESCRIPTION

The SAA5290 is a single-chip one page teletext decoder and television control microcontroller. The device will decode 625-line based World System Teletext transmissions and provides television control functions and On-Screen Display (OSD) functions.

The teletext decoder hardware is a derivative of the SAA5254 (IVT1.1X), and the TV control functionality provided by an on-chip industrial standard 80C51 microcontroller. A single-page static RAM is included on-board providing a complete one page teletext decoder and OSD memory.

The SAA5290 is available as a mask-programmed ROM version. An EEPROM version is also available for product development. Both versions are available in an SDIP52 package.

## ORDERING INFORMATION

| TYPE NUMBER                  | MEMORY | PACKAGE |   |          |
|------------------------------|--------|---------|---|----------|
|                              |        | NAME    | DESCRIPTION   | VERSION  |
| SAA5290ZP/nnn <sup>(1)</sup> | ROM    | SDIP52  | plastic shrink dual in-line package; 52 leads (600 mil) | SOT247-1 |
| SAA5290ZP/NVI <sup>(2)</sup> | EEPROM | SDIP52  | plastic shrink dual in-line package; 52 leads (600 mil) | SOT247-1 |

### Notes

1. nnn is a three-digit number referencing the microcontroller program ROM mask.
2. I is a digit number referring to the language variant of the SAA5290ZP/NV.

## QUICK REFERENCE DATA

| SYMBOL     | PARAMETER                      | MIN. | TYP. | MAX. | UNIT |
|------------|--------------------------------|------|------|------|------|
| $V_{DD}$   | supply voltage                 | 4.5  | 5.0  | 5.5  | V    |
| $I_{DDM}$  | microcontroller supply current | –    | 25   | 40   | mA   |
| $I_{DDA}$  | analog supply current          | –    | 35   | 50   | mA   |
| $I_{DDT}$  | teletext supply current        | –    | 20   | 30   | mA   |
| $f_{xtal}$ | crystal frequency              | –    | 12   | –    | MHz  |
| $T_{amb}$  | operating ambient temperature  | –20  | –    | +70  | °C   |

## PINNING

| SYMBOL            | PIN | DESCRIPTION   |
|-------------------|-----|---|
| P2.0/TPWM         | 1   | <b>PORT 2:</b> 8-bit open-drain bidirectional port with alternative functions. P2.0/TPWM is the output for the 14-bit high precision PWM. P2.1/PWM0 to P2.6/PWM5 are the outputs for the 6-bit PWMs 0 to 5. |
| P2.1/PWM0         | 2   |   |
| P2.2/PWM1         | 3   |   |
| P2.3/PWM2         | 4   |   |
| P2.4/PWM3         | 5   |   |
| P2.5/PWM4         | 6   |   |
| P2.6/PWM5         | 7   |   |
| P2.7              | 8   |   |
| P3.0/ADC0         | 9   | <b>PORT 3:</b> 5-bit open-drain bidirectional port with alternative functions. P3.0/ADC0 to P3.2/ADC2 are the inputs for the software ADC facility.   |
| P3.1/ADC1         | 10  |   |
| P3.2/ADC2         | 11  |   |
| P3.3              | 12  |   |
| P3.4              | 30  |   |
| V <sub>SSD1</sub> | 13  | digital ground 1 for teletext and microcontroller circuits.   |
| P0.0              | 14  | <b>PORT 0:</b> 8-bit open-drain bidirectional port. P0.5 and P0.6 have 10 mA current sinking capability at 0.5 V for direct drive of LEDs.  |
| P0.1              | 15  |   |
| P0.2              | 16  |   |
| P0.3              | 17  |   |
| P0.4              | 18  |   |
| P0.5              | 19  |   |
| P0.6              | 20  |   |
| P0.7              | 21  |   |
| V <sub>SSA</sub>  | 22  | analog ground.  |
| CVBS0             | 23  | Composite video input. A positive-going 1 V (peak-to-peak) input is required, connected via a 100 nF capacitor.   |
| CVBS1             | 24  |   |
| BLACK             | 25  | Video black level storage input. This pin should be connected to V <sub>SSA</sub> via a 100 nF capacitor.   |
| IREF              | 26  | Reference current input for analog circuits, connected to V <sub>SSA</sub> via a 27 kΩ resistor.  |
| FRAME             | 27  | De-interlace output synchronized with the VSYNC pulse to produce a non-interlaced display by adjustment of the vertical deflection currents.  |
| V <sub>SSD2</sub> | 28  | Digital ground 2.   |
| COR               | 29  | Open-drain, active LOW output which allows selective contrast reduction of the TV picture to enhance a mixed mode display.  |
| RGBREF            | 31  | DC input voltage to define the output HIGH level on the RGB pins.   |
| B                 | 32  | Dot rate character output of the BLUE colour information.   |
| G                 | 33  | Dot rate character output of the GREEN colour information.  |
| R                 | 34  | Dot rate character output of the RED colour information.  |
| VDS               | 35  | Video/data switch push-pull output for dot rate fast blanking.  |
| HSYNC             | 36  | Horizontal sync dedicated input for a TTL-level version of the horizontal sync pulse. The polarity of this pulse is programmable by register bit TXT1.H POLARITY.   |

# One page Economy Teletext/TV microcontroller

SAA5290

| SYMBOL           | PIN | DESCRIPTION   |
|------------------|-----|---|
| VSYNC            | 37  | Vertical sync dedicated input for a TTL-level version of the vertical sync pulse. The polarity of this pulse is programmable by register bit TXT1.V POLARITY.   |
| V <sub>DDA</sub> | 38  | +5 V analog power supply.   |
| V <sub>DDT</sub> | 39  | +5 V teletext power supply.   |
| OSCGND           | 40  | Crystal oscillator ground.  |
| OSCIN            | 41  | 12 MHz crystal oscillator input.  |
| OSCOUT           | 42  | 12 MHz crystal oscillator output.   |
| RESET            | 43  | If the reset input is HIGH for 2 machine cycles (24 oscillator periods) while the oscillator is running, the SAA5290 is reset. This pin should be connected to V <sub>DDM</sub> via a 2.2 $\mu$ F capacitor.  |
| V <sub>DDM</sub> | 44  | +5 V microcontroller power supply.  |
| P1.0/INT1        | 45  | <b>PORT 1:</b> 8-bit open-drain bidirectional port with alternative functions. P1.0/INT1 is external interrupt 1 which can be triggered on the rising and falling edge of the pulse. P1.1/T0 is the counter/timer 0. P1.2/INT0 is external interrupt 0. P1.3/T1 is the counter/timer 1. P1.6/SCL is the serial clock input for I <sup>2</sup> C-bus. P1.7/SDA is the serial data port for the I <sup>2</sup> C-bus. |
| P1.1/T0          | 46  |   |
| P1.2/INT0        | 47  |   |
| P1.3/T1          | 48  |   |
| P1.6/SCL         | 49  |   |
| P1.7/SDA         | 50  |   |
| P1.4             | 51  |   |
| P1.5             | 52  |   |

## QUALITY AND RELIABILITY

This device will meet Philips Semiconductors General Quality Specification for Business group "Consumer Integrated Circuits SNW-FQ-611-Part E" (see "Quality Reference Handbook", order number 9398 510 63011). The principal requirements are shown in Tables 1 to 4.

### Group A

**Table 1** Acceptance tests per lot

| TEST       | REQUIREMENTS <sup>(1)</sup> |
|------------|-----------------------------|
| Mechanical | cumulative target: <80 ppm  |
| Electrical | cumulative target: <80 ppm  |

### Group B

**Table 2** Processability tests (by package family)

| TEST                   | REQUIREMENTS <sup>(1)</sup> |
|------------------------|-----------------------------|
| Solderability          | <7% LTPD                    |
| Mechanical             | <15% LTPD                   |
| Solder heat resistance | <15% LTPD                   |

### Group C

**Table 3** Reliability tests (by process family)

| TEST                            | CONDITIONS   | REQUIREMENTS <sup>(1)</sup>   |
|---------------------------------|--|---|
| Operational life                | 168 hours at $T_j = 150\text{ }^{\circ}\text{C}$   | <1500 FPM; equivalent to<br><100 FITS at $T_j = 70\text{ }^{\circ}\text{C}$ |
| Humidity life                   | temperature, humidity, bias<br>1000 hours, $85\text{ }^{\circ}\text{C}$ , 85% RH<br>(or equivalent test) | <2000 FPM   |
| Temperature cycling performance | $T_{\text{stg(min)}}$ to $T_{\text{stg(max)}}$   | <2000 FPM   |

**Table 4** Reliability tests (by device type)

| TEST             | CONDITIONS   | REQUIREMENTS <sup>(1)</sup> |
|------------------|--|-----------------------------|
| ESD and latch-up | ESD Human body model<br>2000 V, 100 pF, 1.5 k $\Omega$     | <15% LTPD                   |
|                  | ESD Machine model<br>200 V, 200 pF, 0 $\Omega$             | <15% LTPD                   |
|                  | latch-up 100 mA, $1.5 \times V_{DD}$<br>(absolute maximum) | <15% LTPD                   |

### Notes to Tables 1 to 4

- ppm = fraction of defective devices, in parts per million.  
LTPD = Lot Tolerance Percent Defective.  
FPM = fraction of devices failing at test condition, in Failures Per Million.  
FITS = Failures In Time Standard.

## LIMITING VALUES

In accordance with Absolute Maximum Rating System (IEC 134).

| SYMBOL          | PARAMETER  | CONDITIONS | MIN. | MAX.           | UNIT |
|-----------------|--|------------|------|----------------|------|
| $V_{DD}$        | supply voltage (all supplies)                          |            | -0.3 | +6.5           | V    |
| $V_I$           | input voltage (any input)                              | note 1     | -0.3 | $V_{DD} + 0.5$ | V    |
| $V_O$           | output voltage (any output)                            | note 1     | -0.3 | $V_{DD} + 0.5$ | V    |
| $I_O$           | output current (each output)                           |            | —    | $\pm 10$       | mA   |
| $I_{IOK}$       | DC input or output diode current                       |            | —    | $\pm 20$       | mA   |
| $\Delta V_{SS}$ | difference between $V_{SSD}$ , $V_{SSA}$ and $OSCGND$  |            | —    | $\pm 0.1$      | V    |
| $\Delta V_{DD}$ | difference between $V_{DDM}$ , $V_{DDT}$ and $V_{DDA}$ | note 2     | —    | $\pm 0.1$      | V    |
| $T_{amb}$       | operating ambient temperature                          |            | -20  | +70            | °C   |
| $T_{stg}$       | storage temperature                                    |            | -55  | +125           | °C   |

## Notes

1. This maximum value has an absolute maximum of 6.5 V independent of  $V_{DD}$ .
2. Except in standby mode.

## CHARACTERISTICS

$V_{DD} = 5\text{ V} \pm 10\%$ ;  $V_{SS} = 0\text{ V}$ ;  $T_{amb} = -20\text{ to }+70\text{ °C}$ ; unless otherwise specified.

| SYMBOL                 | PARAMETER                               | CONDITIONS                 | MIN.        | TYP.         | MAX.              | UNIT |
|------------------------|---|----------------------------|-------------|--------------|-------------------|------|

| $t_{fD}$          | SDA fall time              | $\leq 0.3 \mu s$ | $\leq 0.3 \mu s$ ; note 4 | $\leq 0.3 \mu s$                   |

**Notes**

1. This parameter is determined by the user software. It must comply with the I<sup>2</sup>C-bus specification.
2. This value gives the auto-clock pulse length which meets the I<sup>2</sup>C-bus specification for the special crystal frequency. Alternatively, the SCL pulse must be timed by software.
3. The rise time is determined by the external bus line capacitance and pull-up resistor. It must be less than 1  $\mu s$ .
4. The maximum capacitance on bus lines SDA and SCL is 400 pF.

Fig.3 I<sup>2</sup>C-bus interface timing.

# One page Economy Teletext/TV microcontroller

SAA5290

## FUNCTIONAL DESCRIPTION

### Introduction

The SAA5290 is an integrated teletext decoder and microcontroller. The teletext decoder is derived from the SAA5254 single page teletext decoder IC, with a number of enhancements to increase its suitability for on-screen display applications. The microcontroller is a derivative of the industry standard 80C51 microcontroller. A block diagram of the SAA5290 is given in Fig.1.

### Microcontroller

The functionality of the microcontroller used on the SAA5290 is described here with reference to the industry standard 80C51 microcontroller. A full description of its functionality can be found in the handbook *80C51-based 8-bit microcontrollers IC20*. Using the 80C51 as a reference, the changes made for the SAA5290 fall into two categories, features not supported by the SAA5290 and features found on the SAA5290 but not supported by the 80C51.

### 80C51 features not supported by the SAA5290

#### INTERRUPT PRIORITY

The IP SFR is not implemented and all interrupts are treated with the same priority level. The SAA5290 retains the normal prioritization of interrupts within a level.

**Table 6** Interrupts and their vector addresses

| EVENT                | PROGRAM MEMORY ADDRESS |
|----------------------|------------------------|
| Reset                | 000H                   |
| External INT0        | 003H                   |
| Timer 0              | 00BH                   |
| External INT1        | 013H                   |
| Timer 1              | 01BH                   |
| I <sup>2</sup> C-bus | 053H                   |

#### OFF-CHIP MEMORY

The SAA5290 does not support the use of off-chip program memory or off-chip data memory. This means that the SAA5290 does not have any of  $\overline{EA}$ ,  $\overline{RD}$ ,  $\overline{WR}$ , ALE or  $\overline{PSEN}$  pins. The 4 MOVX instructions which move data to and from external RAM should not be used.

#### IDLE AND POWER-DOWN MODES

Idle and power-down modes are not supported by the SAA5290. As a consequence, the respective bits in PCON are not available.

#### UART FUNCTION

The 80C51 UART is not available in the SAA5290. As a consequence the SCON and SBUF SFRs are removed and the ES bit in the IE SFR is unavailable.

### Additional features for the SAA5290

The following features are provided by the SAA5290 in addition to the standard 80C51 features.

#### INTERRUPTS

The external INT1 interrupt is modified to generate an interrupt on both the rising and falling edges of the INT1 pin, when EX1 bit is set. This facility allows for software pulse width measurement for handling of a remote control.

#### BIT LEVEL I<sup>2</sup>C-BUS INTERFACE

The bit-level serial I/O supports the I<sup>2</sup>C-bus. P1.6/SCL and P1.7/SDA are the serial I/O pins. These two pins meet the I<sup>2</sup>C-bus specification concerning the input levels and output drive capability. Consequently, these pins have an open-drain output configuration. All the four following modes of the I<sup>2</sup>C-bus are supported.

- Master transmitter
- Master receiver
- Slave transmitter

# One page Economy Teletext/TV microcontroller

SAA5290

- Slave receiver.

The advantages of the bit-level I<sup>2</sup>C-bus hardware, compared with a full software I<sup>2</sup>C-bus implementation are:

- The hardware can generate the SCL pulse
- Testing a single bit (RBF or WBF respectively) is sufficient as a check for error-free transmission.

The bit-level I<sup>2</sup>C-bus hardware operates on serial bit level and performs the following functions:

- Filtering the incoming serial data and clock signals
- Recognizing the START condition
- Generating a serial interrupt request SI after reception of a START condition and the first falling edge of the serial clock
- Recognizing the STOP condition
- Recognizing a serial clock pulse on the SCL line
- Latching a serial bit on the SDA line (SDI)
- Stretching the SCL LOW period of the serial clock to suspend the transfer of the next serial data bit
- Setting Read Bit Finished (RBF) when the SCL clock pulse has finished and Write Bit Finished (WBF) if there is no arbitration loss detected (i.e. SDA = logic 0 while SDO = logic 1)
- Setting a serial clock LOW-to-HIGH detected (CLH) flag
- Setting a Bus Busy (BB) flag on a START condition and clearing this flag on a STOP condition
- Releasing the SCL line and clearing the CLH, RBF and WBF flags to resume transfer to the next serial data bit
- Generating an automatic clock if the single bit data register S1BIT is used in master mode.

The following functions must be done in software:

- Handling the I<sup>2</sup>C-bus START interrupts
- Converting serial data to parallel data when receiving
- Converting parallel data to serial data when transmitting
- Comparing the received slave address with its own address
- Interpreting the acknowledge information
- Guarding the I<sup>2</sup>C-bus status if RBF or WBF = logic 0.

Additionally, if acting as master:

- Generating START and STOP conditions
- Handling bus arbitration
- Generating serial clock pulses if S1BIT is not used.

Three SFRs support the function of the bit-level I<sup>2</sup>C-bus hardware, they are S1INT, S1BIT and S1SCS.

## LED SUPPORT

Port pins P0.5 and P0.6 have a 10 mA current sinking capability to enable LEDs to be driven directly.

## PWM DACs

The SAA5290 has six 6-bit PWM DACs and one 14-bit PWM DAC. These allow direct control of other parts of the television.

The low resolution 6 bit DACs are controlled by their corresponding SFR (PWM0 to PWM5) and are connected as alternative outputs of Port P2. The port bit corresponding to the PWM should be set to logic 1 for correct operation of the PWM.

**Table 7** Special Function Registers PWM0 to PWM5

| D7  | D6 | D5  | D4  | D3  | D2  | D1  | D0  |
|-----|----|-----|-----|-----|-----|-----|-----|
| PWE | –  | PV5 | PV4 | PV3 | PV2 | PV1 | PV0 |

If the PWE bit for a particular port is set to logic 1, the PWM is active and controls its assigned port pin. If the PWE bit is set to logic 0 the corresponding port pin is controlled by the bit in the corresponding port register for that port.

The output of the PWM is a pulse of period 21.33  $\mu$ s with a duty cycle determined by the binary value, PV5 to PV0, multiplied by 0.33  $\mu$ s. The 14 bit PWM is controlled with SFR registers TDACL and TDACH.

**Table 8** Special Function Register TDACL

| D7  | D6  | D5  | D4  | D3  | D2  | D1  | D0  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| TD7 | TD6 | TD5 | TD4 | TD3 | TD2 | TD1 | TD0 |

**Table 9** Special Function Register TDACH

| D7  | D6 | D5   | D4   | D3   | D2   | D1  | D0  |
|-----|----|------|------|------|------|-----|-----|
| PWE | –  | TD13 | TD12 | TD11 | TD10 | TD9 | TD8 |

If the PWE bit is set to logic 1, the TPWM is active and controls Port P2.0. If the PWE bit is set to logic 0 the port pin is controlled by the bit in the corresponding port register for P2.0.

The output of the TPWM is a pulse of period 42.66  $\mu$ s with a duty cycle determined by the binary value, TD13 to TD7, multiplied by 0.33  $\mu$ s.

---

## One page Economy Teletext/TV microcontroller

---

SAA5290

The 7 least significant bits, TD6 to TD0, extend the HIGH time of a proportion of the pulses by 0.33  $\mu$ s. If the LSB is set then 1 in 128 cycles is extended, if bit 1 is set then 1 in 64 cycles is extended, and so on.

### SOFTWARE ADC

Up to 3 successive approximation ADCs can be implemented in software by making use of the on-board 4-bit DAC and multiplexed voltage comparator. The software ADC uses 3 analog inputs which are multiplexed with P3.0 to P3.2.

The control of the ADC is achieved using the SAD SFR. SAD.5 and SAD.6 select one of the three inputs to pass to the comparator. The other input comes from the DAC whose input is set by SAD bits 0 to 3. The output of the comparator is SAD bit 7 and is valid by the next instruction after starting the comparison by setting SAD.ST to logic 1.

### Microcontroller interfacing

The 80C51 CPU communicates with the peripheral functions using Special Function Registers (SFRs) which are addressed as RAM locations. The registers in the teletext decoder appear as normal SFRs in the microcontroller memory map, but are written to using a serial bus. This bus is controlled by dedicated hardware which uses a simple handshake system for software synchronization. The SFR memory map is given in Table 10.

## Notes

1. The star (\*) indicates these bits are inactive and must be written to logic 0 for future compatibility.
2. SFRs are bit addressable.
3. SFRs are modified or added to the 80C51 SFRs.

One page Economy Teletext/TV  
microcontroller

SAA5290

## TELETEXT DECODER FUNCTIONAL DESCRIPTION

## Data slicer

The data slicer extracts the digital teletext data from the incoming analog waveform. This is performed by sampling the CVBS waveform and processing the samples to extract the teletext data and clock.

## Acquisition timing

The acquisition timing is generated from a logic level positive-going composite sync signal 'VCS'. This signal is generated by the sync separator circuit which adaptively slices the sync pulses at 50% of their height. It is able to do this over a wide range of sync amplitudes by using the same basic principle used on VIP1 (SAA5230) and VIP2 (SAA5231).

Figure 4 is a block diagram showing the principles of operation. It relies upon the fact that the ratio of the sync width to the line time is approximately 13 : 1. In order to slice the sync pulse at the correct 50% level two currents are generated.

One is constant and is proportional to the difference between the black level of the video and the slicing level. The other is produced only when the video is below the slicing level, and is also proportional to the difference between the slicing level and the input, but has a magnitude 13 times greater.

The black level is determined by a sync-gated peak detector. The video is negatively peak detected into an external capacitor (BLACK, pin 25), but not during the sync pulse VCS. The two currents are integrated on the CVBS input coupling capacitor and the net effect is to alter the mean input voltage until the (fixed) slicing level is correct.

The acquisition clocking and timing are locked to the VCS signal using a digital phased-locked-loop. The phase error in the acquisition phase-locked-loop is detected by a signal quality circuit which disables acquisition if poor signal quality is detected.

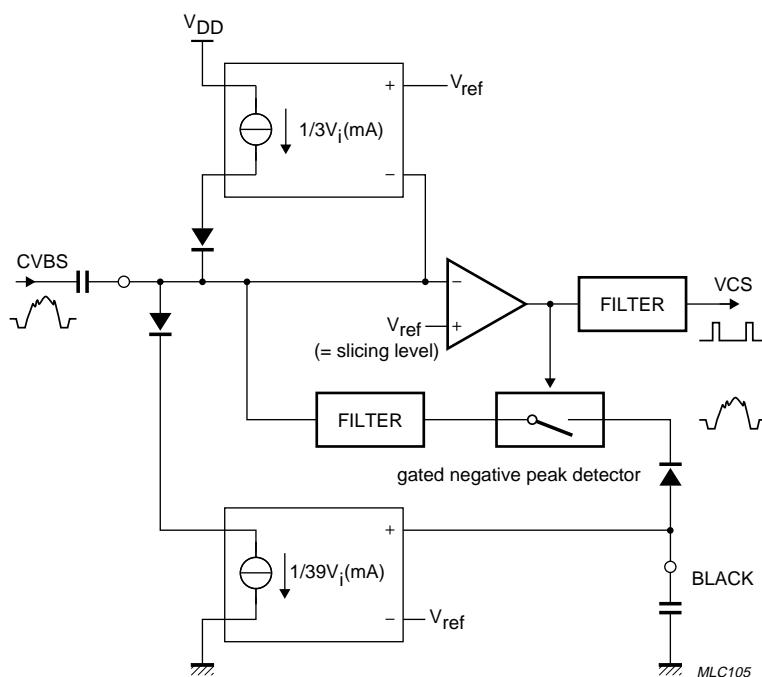

Fig.4 Sync separator block diagram.

# One page Economy Teletext/TV microcontroller

SAA5290

## Teletext acquisition

The SAA5290 is able to acquire 625-line World System Teletext. Teletext is acquired under control of the on-board 80C51 microcontroller. Pages are requested by writing a series of bytes into the TXT3 SFR which corresponds to the number of the page required. The bytes written into TXT3 are put into a small RAM with an auto-incrementing address. The start address for the RAM is set using the SFR TXT2 register. Table 13 shows the contents of the page request RAM.

If the 'DO CARE' bit for part of the page number is set to logic 0 then that part of the page number is ignored when the acquisition section is deciding whether a page being received off air should be stored or not. For example if the 'DO CARE' bits for the 4 subcode digits are all set to logic 0 then every subcode version of the page will be captured.

When the 'HOLD' bit is set to logic 0 the acquisition section will not recognize any page as having the correct page number and no pages will be captured.

**Table 13** Register map for page requests (TXT3); note 1

| START<br>COLUMN | PRD4                     | PRD3                     | PRD2 | PRD1 | PRD0 |
|-----------------|--------------------------|--------------------------|------|------|------|
| 0               | DO CARE<br>Magazine      | $\overline{\text{HOLD}}$ | MAG2 | MAG1 | MAG0 |
| 1               | DO CARE<br>Page tens     | PT3                      | PT2  | PT1  | PT0  |
| 2               | DO CARE<br>Page units    | PU3                      | PU2  | PU1  | PU0  |
| 3               | DO CARE<br>Hours tens    | X                        | X    | HT1  | HT0  |
| 4               | DO CARE<br>Hours units   | HU3                      | HU2  | HU1  | HU0  |
| 5               | DO CARE<br>Minutes tens  | X                        | MT2  | MT1  | MT0  |
| 6               | DO CARE<br>Minutes units | MU3                      | MU2  | MU1  | MU0  |

## Note

1. X = don't care.

## Page memory organization

The acquired teletext packets each contain 40 bytes of data and one packet is stored in each row of the text memory. The page memory organization is given in Fig.5. Rows 0 to 23 form the teletext page; Row 24 is available for status messages and FLOF/FASTEXT prompt information.

# One page Economy Teletext/TV microcontroller

SAA5290

Fig.5 Basic page memory organization.

## Row 0 (see Fig.5)

Row 0 is for the page header. The first seven characters (0 to 6) are free for status messages. Character 8 is an alphanumeric white or green control character, written automatically by SAA5290 to give a green rolling header when a page is being looked for. The last eight characters are for rolling time.

## Row 25 (see Fig.5)

The first 10 bytes of row 25 contain control data relating to the received page as shown in Table 14. The remaining 14 bytes are free for use by the microcontroller.

## Extension packet memory organization

If TXT0.X24 POS bit is set to logic 0, then Packet 24 is written into Row 0 of the extension memory.

Packet X27/0 is written to Row 1 of the extension memory, with bytes 0 to 37 being Hamming checked automatically.

Packet 8/30 is written to Row 2 of the extension memory, with bytes 0 to 6 being 8/4 Hamming checked, bytes 7 to 19 unchecked and bytes 20 to 39 odd parity checked.

## Packet 26 processing

The SAA5290 contains on-board hardware processing of Packet 26 data. If a character corresponding to that being transmitted is available in the character set then the correct character code is written into the display memory.

|                                | ROW |
|--------------------------------|-----|
| PACKET X24 if TXT0.X24 POS = 0 | 0   |
| PACKET X27 / 0                 | 1   |
| PACKETS 8 / 30 / 0 to 15       | 2   |

# One page Economy Teletext/TV microcontroller

SAA5290

## Display

The capabilities of the display are based on the requirements of level 1 teletext, with some enhancements for use with locally generated On-Screen Displays (OSD).

The display consists of 25 rows each of 40 characters, with the characters displayed being those from Rows 0 to 24 of the basic page memory. The page memory stores 8-bit character codes which correspond to 260 displayable characters and 44 control codes, normally displayed as spaces. Each character is defined by a matrix 12 pixels high and 10 pixels deep. When displayed each pixel is 0.5  $\mu$ s wide and 1 TV line, in each field, high.

The SAA5290 signals the TV display circuits to display the RGB outputs of the SAA5290 rather than video picture by setting VDS HIGH. The way in which this signal is switched is controlled by the TXT5 and TXT6 SFRs. There are three control functions: background on, text on and picture on. There are separate bits for each function for inside and outside teletext boxes and if the newflash or subtitle bits are set. This allows the software to configure the type of display required. The effect of the combination of these bits is given in Table 16. The COR bits in Register 5 and Register 6 control when the output is pulled LOW. This output is intended to act on the TV display circuits to reduce the contrast of the video display.

The display character set is given in Fig.9. The character set provided contains all the characters required to display Eastern and Western European languages. Register bit TXT4.EAST/ WEST sets whether Eastern or Western languages are set with the C12 to C14 bits. In order to make on-screen displays easy to use, the SAA5290 contains additional display attributes in Column 11.

Control codes are categorized as 'set at' or 'set after'. 'Set at' means the code has effect at the current character position and 'set after' means they have effect from the following character. Codes 11/0 to 11/7 are always 'set at'. Codes 11/11 to 11/15 are 'set after' when defining the start of an OSD box and 'set at' when ending an OSD box. Codes 11/12 to 11/15 force a box condition allowing on-screen display messages to be displayed without having to erase the whole contents of the teletext page.

On-screen displays are only available in TV mode and not in text mode. In mixed text and TV mode the displayed screen is not defined if an OSD box is encountered in the page memory.

**Table 16** Display mode

| PICTURE ON | TEXT ON | BACKGROUND ON | RESULT                                  |
|------------|---------|---------------|---|
| 0          | 0       | X             | text mode, black screen                 |
| 0          | 1       | 0             | text mode, background always black      |
| 0          | 1       | 1             | text mode                               |
| 1          | 0       | X             | TV mode                                 |
| 1          | 1       | 0             | mixed mode and TV mode                  |
| 1          | 1       | 1             | text mode, TV picture outside text area |

## Display timing

The display circuitry is driven from the H/VSNC inputs, and is independent of the input video signal. Consequently HSYNC and VSYNC are always required to slave synchronize the display.

The FRAME output of the SAA5290 is provided to facilitate de-interlacing the teletext display. The behaviour of FRAME is controlled via the register bits TXT0.DISABLE FRAME, TXT0.AUTO FRAME and TXT1.FIELD POLARITY. If the active edge of VSYNC occurs in the first half of a TV line then the field is even, and

if the active edge of VSYNC is in the second half of a line then the field is odd. The active edge is controlled with TXT1.V POLARITY. With TXT0.AUTO FRAME LOW FRAME is HIGH for an odd field and LOW for an even field. With TXT0.AUTO FRAME HIGH FRAME is only active when text is being displayed, when video is displayed it is forced LOW. When TXT0.DISABLE FRAME is HIGH FRAME is always LOW. If TXT1.FIELD POLARITY is logic 1 then VSYNC is delayed by 32  $\mu$ s before being applied to the display timing circuits.

SAA5290

## Clock generator

The oscillator circuit of the SAA5290 is a single-stage inverting amplifier in a Pierce oscillator configuration. The circuitry between OSCIN and OSCOUT is basically an inverter biased to the transfer point. A crystal must be used as the feedback element to complete the oscillator

circuitry. It is operated in parallel resonance. OSCIN is the high gain amplifier input and OSCOUT is the output. To drive the SAA5290 externally OSCIN is driven from an external source and OSCOUT is left open-circuit.

(1) The values of C1 and C2 depend on the crystal specification:  
 $C1 = C2 = 2C_L$ .

## SOLDERING

### Plastic dual in-line packages

BY DIP OR WAVE

The maximum permissible temperature of the solder is 260 °C; this temperature must not be in contact with the joint for more than 5 s. The total contact time of successive solder waves must not exceed 5 s.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the

specified storage maximum. If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

### REPAIRING SOLDERED JOINTS

Apply the soldering iron below the seating plane (or not more than 2 mm above it). If its temperature is below 300 °C, it must not be in contact for more than 10 s; if between 300 and 400 °C, for not more than 5 s.

## DEFINITIONS

| Data sheet status   |   |
|---|---|
| Objective specification   | This data sheet contains target or goal specifications for product development.       |
| Preliminary specification   | This data sheet contains preliminary data; supplementary data may be published later. |
| Product specification   | This data sheet contains final product specifications.                                |
| Limiting values   |   |
| Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability. |   |
| Application information   |   |
| Where application information is given, it is advisory and does not form part of the specification.   |   |

## LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

## PURCHASE OF PHILIPS I<sup>2</sup>C COMPONENTS

Purchase of Philips I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C system provided the system conforms to the I<sup>2</sup>C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
