

SP5054

2.6 GHz 3-WIRE BUS CONTROLLED SYNTHESISER

The SP5054 is a single-chip frequency synthesiser designed for satellite TV tuning systems. It is a programming variant of the SP5055, allowing the design of one tuner with either I^2C bus or 3-wire bus format, depending on which device is inserted. The SP5054, when used with a satellite varactor tuner, forms a complete phase locked loop tuning system.

The circuit consists of a divide-by-16 prescaler with its own preamplifier and a 14/15-bit programmable divider controlled by aserially-loadeddataregister. Four independently programmable open-collector outputs are included. The device has four modes of operation, selected by the Mode Select input; these modes are summarised in Table 1.

The comparison frequencies are obtained by the division of the output of a 4MHz crystal controlled on-chip oscillator. The phase comparator has a charge pump output with an output amplifier stage around which feedback may be applied. Only one external transistor is required for varactor line driving.

FEATURES

- Complete2·6GHzSingleChipSystem
- 62·5kHz,100kHzand125kHzStepSize
- LowPowerConsumption(325mWTyp.)
- ProgrammingCompatiblewithToshibaTD6380,TD6381 andTD6382*
- PinCompatiblewithSP5055*
- LowRadiation
- VaractorDriveAmplifierDisable
- ChargePumpDisable
- SinglePort18/19BitSerialDataEntry
- FourControllableOutputs
- ESDProtection†
 - * See notes on pin compatibility
 †NormalESDhandlingprecautionsshouldbeobserved

APPLICATIONS

- SatelliteTV
- HighIFCableTuningSystems

ELECTRICAL CHARACTERISTICS

 $T_{AMB} = -20^{\circ}\text{C}$ to $+80^{\circ}\text{C}$, $V_{CC} = +4.5\text{V}$ to +5.5V. Frequency standard = 4MHz. All pin connections refer to DP package. These Characteristics are guaranteed by either production test or design. They apply within the specified ambient temperature and supply voltage ranges unless otherwise stated.

FUNCTIONALDESCRIPTION

The SP5054 contains all the elements necessary, with the exception of reference crystal, loop filter and external high voltage transistor, to control a voltage controlled local oscillator, so forming a PLL frequency synthesised source.

The system is controlled by a microprocessor via a standard Data, Clock and Enable three-wire data bus.

The data load normally consists of a single word, which contains the frequency and port information, and is only transferred to the internal data shift register during an enable high period

The clock input is disabled during enable low periods. New data words are only accepted by the internal data buffers from the shift register on a negative transition of the Enable, so giving improved fine tune facility for digital AFC etc.

The data sequence and timing follows the format shown in Fig. 4.

The frequency is set by loading the programmable divider with therequired 14/15 bit divisorword. The output of this divider, F_{PD} , is fed to the phase comparator where it is compared in phase and frequency domain to the internally generated comparison frequency, F_{COMP} .

 F_{COMP} is obtained by dividing the output of an on-chip crystal controlled oscillator. The crystal frequency used is generally 4MHz, which gives an F_{COMP} of 3.90625/6.25/7.8125kHz and,

when multiplied back up to the synthesised LO, gives a minimum step size of 62·5/100/125kHz, respectively.

The programmable divider is preceded by an input RF preamplifier and high speed, low radiation prescaler. The preamplifier is arranged to be self oscillating, so giving excellent input sensitivity.

The SP5054 contains an improved lock detect circuit which generates a flag when the loop has attained lock. 'In lock' is indicated by high impedance state.

The SP5054 contains 4 general purpose open collector outputs, ports P1-P4, which are capable of sinking at least 10mA. These outputs are set by the remaining four bits within the normal data word.

NOTES ON PIN COMPATIBILITY

The SP5054 may be used in SP5055 applications which require 3-wire bus as opposed to I²C bus data format. In SP5055 applications where the reference crystal is grounded to pin 3, a small modification is required to ground the crystal as shown in Fig. 5.

Appropriate connections must also be made to the Mode Select input (see Table 1). In Mode 3, The SP5054 is programming compatible with the Toshiba TD6380, in Modes 0 and 2 with the TD6381 and in Mode 1 with the TD6382.
