DUAL ASYMMETRICAL OVERVOLTAGE
PROTECTION FOR TELECOM LINE

MAIN APPLICATIONS

Where asymmetrical protection against lightning strikes and other transient overvoltages is required :

- Solid-State relays
- SLIC with integrated ring generator

DESCRIPTION

The SSRP130B1 is a dual asymmetrical transient voltage suppressor designed to protect a solid-state ring relay or SLICs with integrated ring generator from overvoltages.

The asymmetrical protection configuration is necessary to allow the use of all different types of ringing schemes.

FEATURES

- Dual bidirectional asymmetrical protection :
Stand-off voltages :
+ 130V for positive voltages
- 185V for negative voltages
- Peak pulse current : $I_{PP} = 2 * 25A$ (5 / 310 μs)
- Holding current : 150mA

APPLICATION INFORMATION

Fig 1 : Topology of the classical line card protection.

The classical line card requires protection before the ring relay and a second one for the SLIC (fig.1). The use of new SLICs with integrated ring generator or board based on solid state ring relay suppresses this second protection (Fig. 2). Then the only remaining stage, located between the line and the ring relay, has to optimize the protection. The classical symmetrical first stage protector becomes not sufficient to avoid any circuit destruction during surges.

Fig 2 : Classical use of the SSRP130B1.

The SSRP130B1 device takes into account this fact and is based on asymmetrical voltage characteristics (Fig.3a). The ring signal being shifted back by the battery voltage, the SSRP130B1 negative breakover value V_{bo-} is greater than the positive one V_{bo+} . This point guarantees a protection operation very close to the peak of the normal operating voltage without any disturbance of the ring signal.

Fig 3 : SSRP130B1 electrical characteristics.

In addition with the 2 crowbar functions which perform the protection of both TIP and RING lines versus ground, a third cell assumes the differential mode protection of the SLIC. The breakdown voltage values of this third cell are the same for

both positive and negative parts of the characteristics and are equivalent to the negative breakdown voltage value of the TIP and RING lines versus GND cells (Fig.3 b).

FUNCTION HOLDING CURRENT (I_H) TEST CIRCUIT (GO-NO GO TEST)

This is a GO-NOGO test which allows to confirm the holding current (I_H) level in a functional test circuit.

TEST PROCEDURE :

- 1) Adjust the current level at the I_H value by short circuiting the D.U.T.
- 2) Fire the D.U.T with a surge Current : $I_{PP} = 10A$, 10/1000 ms.
- 3) The D.U.T will come back off-state within 50 ms max.
