Low power mixers/oscillators for hyperband tuners

TDA5744; TDA5745

FEATURES

- Mixers/oscillators for hyperband tuners
- Balanced mixer with a common emitter input for VHF (single input)
- Balanced mixer with a common base input for UHF (double input)
- 4-pin common emitter oscillator for VHF
- 4-pin common emitter oscillator for UHF
- Electronic band switch
- IF amplifier with a low output impedance to drive the SAW filter directly ($\approx 2 \text{ k}\Omega$ load)
- Low power, low radiation and small size
- Pin compatible single-chip synthesizer mixer/oscillator for Full Scale Tuners (FST) are available: TDA6404, TDA6405 and TDA6405A.

APPLICATIONS

- Hyperband tuners for Europe using a 2-band mixer/oscillator in a switched concept.

GENERAL DESCRIPTION

The TDA5744 and TDA5745 are 2-band mixers/oscillators intended for VHF/UHF and hyperband tuners (see Fig.1).

The Integrated Circuits (ICs) include two double balanced mixers and two oscillators, for the VHF and UHF band, and an IF amplifier. With proper oscillator application and by using a switchable inductor to split the VHF band into two sub-bands (the full VHF/UHF and hyperband) the TV bands can be covered. Two pins are available between the mixer output and the IF amplifier input to enable IF filtering for improved signal handling. Band selection is made by band switch pin BS.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{CC}	supply voltage	operating	4.5	5	5.5	V

Low power mixers/oscillators for hyperband tuners

TDA5744; TDA5745

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_i	input conductance	$f_{RF} = 45.25 \text{ MHz}$	—	0.25	—	mS
		$f_{RF} = 399.25 \text{ MHz}$	—	0.5	—	mS
C_i	input capacitance	$f_{RF} = 45.25 \text{ to } 399.25 \text{ MHz}$	—	2	—	pF
V_o	output voltage causing 1% cross modulation in channel	$f_{RF} = 45.25 \text{ MHz}$; see Fig.6	116	119	—	$\text{dB}\mu\text{V}$
		$f_{RF} = 399.25 \text{ MHz}$; see Fig.6	116	119	—	$\text{dB}\mu\text{V}$
V_i	input voltage causing pulling in channel (750 Hz)	$f_{RF} = 399.25 \text{ MHz}$; note 1	—	88	—	$\text{dB}\mu\text{V}$
G_V	voltage gain	$f_{RF} = 45.25 \text{ MHz}$; see Fig.4	24.5	27	29.5	dB
		$f_{RF} = 399.25 \text{ MHz}$; see Fig.4	24.5	27	29.5	dB

VHF oscillator

f_{osc}	oscillator frequency		84.15	—	438.15	MHz
$\Delta f_{osc(V)}$	oscillator frequency shift with supply voltage	$\Delta V_{CC} = 5\%$; note 2	—	100	200	kHz
		$\Delta V_{CC} = 10\%$; worst case in the frequency range; note 2	—	200	—	kHz
$\Delta f_{osc(T)}$	oscillator frequency drift with temperature	$\Delta T = 25 \text{ }^{\circ}\text{C}$ without compensation: NP0 capacitors; worst case in the frequency range; note 3	—	1300	tbf	kHz
$\Delta f_{osc(t)}$	oscillator frequency drift with time	worst case in the frequency range; note 4	—	600	tbf	kHz
Φ_{osc}	phase noise, carrier-to-noise sideband	$\pm 100 \text{ kHz}$ frequency offset; worst case in the frequency range	—	106	—	dBc/Hz
$RSC_{(p-p)}$	ripple susceptibility of V_{CC} (peak-to-peak value)	$V_{CC} = 5 \text{ V}$; worst case in the frequency range; ripple frequency 500 kHz; note 5	15	40	—	mV

UHF mixer (including IF amplifier)

$f_{I(RF)}$	RF input frequency	picture carrier frequency	407.25	—	855.25	MHz
F	noise figure	$f_{RF} = 407.25 \text{ MHz}$; see Fig.10	—	8	10	dB
		$f_{RF} = 855.25 \text{ MHz}$; not corrected for image; see Fig.10	—	9	11	dB
R_s	real part of $Z_i = R_s + j\omega L_s$	$f_{RF} = 407.25 \text{ MHz}$	—	30	—	Ω
		$f_{RF} = 855.25 \text{ MHz}$	—	38	—	Ω
L_s	imaginary part of $Z_i = R_s + j\omega L_s$	$f_{RF} = 407.25 \text{ MHz}$	—	9	—	nH
		$f_{RF} = 855.25 \text{ MHz}$	—	6	—	nH
V_o	output voltage causing 1% cross modulation in channel	$f_{RF} = 407.25 \text{ MHz}$; see Fig.7	116	119	—	$\text{dB}\mu\text{V}$
		$f_{RF} = 855.25 \text{ MHz}$; see Fig.7	114	117	—	$\text{dB}\mu\text{V}$
V_i	input voltage causing pulling in channel (750 Hz)	$f_{RF} = 855.25 \text{ MHz}$; note 1	—	78	—	$\text{dB}\mu\text{V}$
G_V	voltage gain	$f_{RF} = 407.25 \text{ MHz}$; see Fig.4	35	38	41	dB
		$f_{RF} = 855.25 \text{ MHz}$; see Fig.4	35	38	41	dB

Low power mixers/oscillators for hyperband tuners

TDA5744; TDA5745

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
UHF oscillator						
f_{osc}	oscillator frequency		446.15	–	894.15	MHz
$\Delta f_{osc(V)}$	oscillator frequency shift with supply voltage	$\Delta V_{CC} = 5\%$; note 2	–	30	80	kHz
		$\Delta V_{CC} = 10\%$; worst case in the frequency range; note 2	–	80	tbf	kHz
$\Delta f_{osc(T)}$	oscillator frequency drift with temperature	$\Delta T = 25^\circ C$; with compensation; worst case in the frequency range; note 3	–	600	tbf	kHz
$\Delta f_{osc(t)}$	oscillator frequency drift with time	worst case in the frequency range; note 4	–	200	tbf	kHz
Φ_{osc}	phase noise, carrier-to-noise sideband	± 100 kHz frequency offset; worst case in the frequency range	–	106	–	dBc/Hz
$RSC_{(p-p)}$	ripple susceptibility of V_{CC} (peak-to-peak value)	$V_{CC} = 5$ V; worst case in the frequency range; ripple frequency 500 kHz; note 5	15	20	–	mV
Rejection at the IF amplifier output

INT_{S02}	S02 beat	note 7	66	–	–	dBc

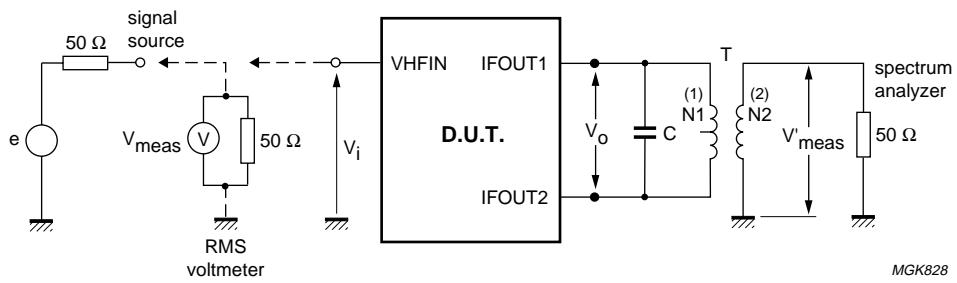

Notes

1. This is the level of the RF signal (100% amplitude modulated with 11.89 kHz) that causes a 750 Hz frequency deviation on the oscillator signal; it produces sidebands 30 dB below the level of the oscillator signal.
2. The frequency shift is defined as the change of the oscillator frequency when the supply voltage varies from $V_{CC} = 5$ to 4.5 V or from $V_{CC} = 5$ to 5.25 V. The oscillator is free-running during this measurement.
3. The frequency drift is defined as the change of the oscillator frequency when the ambient temperature varies from $T_{amb} = 25$ to 0 °C or from $T_{amb} = 25$ to 50 °C. The oscillator is free-running during this measurement.
4. The switching on drift is defined as the change of the oscillator frequency between 5 seconds and 15 minutes after switching on. The oscillator is free-running during this measurement.
5. The ripple susceptibility is measured for a 500 kHz ripple at the IF amplifier output using the measurement circuit; the level of the ripple signal is increased until a difference of 53.5 dB between the IF carrier set at 100 dB μ V and the sideband components is reached.
6. Channel x beat: picture carrier frequency (f_{pc}) and sound carrier frequency (f_{sc}) both at 80 dB μ V. The rejection of the interfering product $f_{pc(RF)} + f_{sc(RF)} - f_{osc}$ at 35.35 MHz should be >60 dB.
7. Channel S02: f_{pc} is 76.25 MHz at 70 dB μ V; $f_{osc} = 115.15$ MHz. The rejection of $f_{osc} - 2 \times f_{IF}$ = 37.35 MHz should be >66 dB.

SOLDERING

Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "IC Package Databook" (order code 9398 652 90011).

Reflow soldering

Reflow soldering techniques are suitable for all SSOP packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

Wave soldering

Wave soldering is **not** recommended for SSOP packages. This is because of the likelihood of solder bridging due to closely-spaced leads and the possibility of incomplete solder penetration in multi-lead devices.

If wave soldering cannot be avoided, the following conditions must be observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow and must incorporate solder thieves at the downstream end.

Even with these conditions, only consider wave soldering SSOP packages that have a body width of 4.4 mm, that is SSOP16 (SOT369-1) or SSOP20 (SOT266-1).

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

Repairing soldered joints

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

Low power mixers/oscillators for hyperband tuners

TDA5744; TDA5745

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
