

**Features**

- 256Kx8-bit Organization
- Address Access Time: 90 ns
- Single 5V  $\pm$  10% Power Supply
- Sector Erase Mode Operation
- 512 bytes per Sector, 512 Sectors
  - Sector-Erase Cycle Time: 10ms (Max)
  - Byte-Write Cycle Time: 30 $\mu$ s (Max)
- Minimum 1,000 Erase-Program Cycles
- Low power dissipation
  - Active Read Current: 20mA (Typ)
  - Active Program Current: 30mA (Typ)
  - Standby Current: 100 $\mu$ A (Max)
- Low V<sub>CC</sub> Program Inhibit Below 3.5V
- CMOS and TTL Interface
- Packages:
  - 32-pin Plastic DIP
  - 32-pin PLCC

**Description**

The V29LC51002 is a high speed 262,144 x 8 bit CMOS flash memory. Writing or erasing the device is done with a single 5 Volt power supply. The device has separate chip enable  $\overline{CE}$ , write enable  $\overline{WE}$ , and output enable  $\overline{OE}$  controls to eliminate bus contention.

The V29LC51002 features a sector erase operation which allows each sector to be erased and reprogrammed without affecting data stored in other sectors. The device also supports full chip erase.

**NOTE:**

1. Stress greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. No more than one output maybe shorted at a time and not exceeding one second long.

**FUNCTIONAL DESCRIPTION****Read Cycle**

A read cycle is performed by holding both  $\overline{CE}$  and  $\overline{OE}$  signals LOW. Data Out becomes valid only when these conditions are met. During a read cycle  $\overline{WE}$  must be HIGH prior to  $\overline{CE}$  and  $\overline{OE}$  going LOW.  $\overline{WE}$  must remain HIGH during the read operation for the read to complete (see Table 1).

**Output Disable**

Returning  $\overline{OE}$  or  $\overline{CE}$  HIGH, whichever occurs first will terminate the read operation and place the I/O pins in the HIGH-Z state.

**Standby**

The device will enter standby mode when the  $\overline{CE}$  signal is HIGH. The I/O pins are placed in the HIGH-Z, independent of the  $\overline{OE}$  input state.

**Byte Write Cycle**

The V29LC51002 is programmed on a byte-by-byte basis. The byte write operation is initiated by using a specific four-bus-cycle sequence: two unlock program cycles, a program setup command and program data program cycles (see Table 2).

During the byte write cycle, addresses are latched on the falling edge of either  $\overline{CE}$  or  $\overline{WE}$ , whichever is last. Data is latched on the rising edge of  $\overline{CE}$  or  $\overline{WE}$ , whichever is first. The byte write cycle can be  $\overline{CE}$  controlled or  $\overline{WE}$  controlled.

**V29LC51002****Sector Erase Cycle**

The V29LC51002 features a sector erase operation which allows each sector to be erased and reprogrammed without affecting data stored in other sectors. Sector erase operation is initiated by using a specific six-bus-cycle sequence: Two unlock program cycles, a setup command, two additional unlock program cycles, and the sector erase command (see Table 2). A sector must be first erased before it can be re-written. While in the internal erase mode, the device ignores any program attempt into the device. Sector erase is completed in 10ms max. The V29LC51002 is shipped fully erased (all bits = 1).

**Chip Erase Cycle**

The V29LC51002 features a chip-erase operation. The chip erase operation is initiated by using a specific six-bus-cycle sequence: two unlock program cycles, a setup command, two additional unlock program cycles, and the chip erase command (see Table 2).

The automatic erase begins on the rising edge of the last  $\overline{WE}$  or  $\overline{CE}$  pulse in the command sequence and is completed in 3 sec max.
