## HIGH VOLTAGE IGNITION COIL DRIVER POWER IC

TYPE	$V_{cl}$	$I_{cl}$	$I_d$
VB026SP	360 V	9 A	100 mA

- PRIMARY COIL VOLTAGE INTERNALLY SET
- COIL CURRENT LIMIT INTERNALLY SET
- LOGIC LEVEL COMPATIBLE INPUT
- DRIVING CURRENT QUASI PROPORTIONAL TO COLLECTOR CURRENT
- SINGLE FLAG-ON COIL CURRENT

### DESCRIPTION

The VB026SP is a high voltage power integrated circuit made using STMicroelectronics VIPower Technology, with vertical current flow power darlington and logic level compatible driving circuit.

Built-in protection circuits for coil current limiting and collector voltage clamping allows the VB026SP to be used as a smart, high voltage, high current interface in advanced electronic ignition systems.

**PRINCIPLE OF OPERATION**

The VB026SP is mainly intended as a high voltage power switch device driven by a logic level input and interfaces directly to a high energy electronic ignition coil.

The input  $V_{in}$  of the VB026SP is fed from a low power signal generated by an external controller that determines both dwell time and ignition point. During  $V_{in}$  high ( $\geq 4V$ ) the VB026SP increases current in the coil to the desired, internally set current level.

After reaching this level, the coil current remains constant until the ignition point, that corresponds to the transition of  $V_{in}$  from high to low (typ. 1.9V threshold).

During the coil current switch-off, the primary

voltage  $HV_c$  is clamped at an internally set value  $V_{cl}$ , typically 360V.

The transition from saturation to desaturation, coil current limiting phase, must have the ability to accommodate an overvoltage. A maximum overshoot of 20V is allowed.

**FEEDBACK**

When the collector current exceeds 6.5A, the feedback signal is turned high and it remains so, until the input voltage is turned-off.

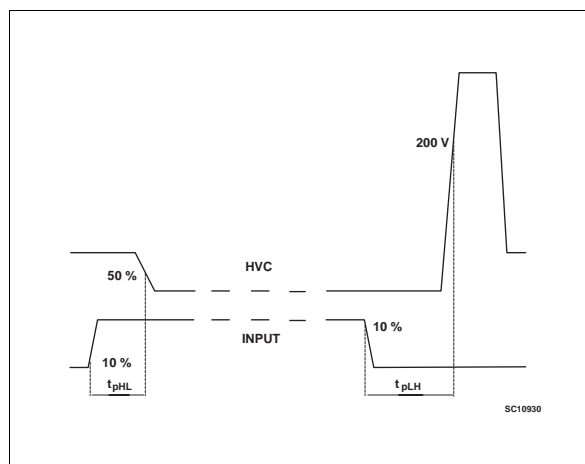

**OVERVOLTAGE**

The VB026SP can withstand the following transients of the battery line:

-100V/2msec ( $R_i = 10 \Omega$ )

+100V/0.2msec ( $R_i = 10 \Omega$ )

+50V/400msec ( $R_i = 4.2 \Omega$ , with  $V_{IN} = 3 V$ )
