## QUAD CHANNEL HIGH SIDE SOLID STATE RELAY

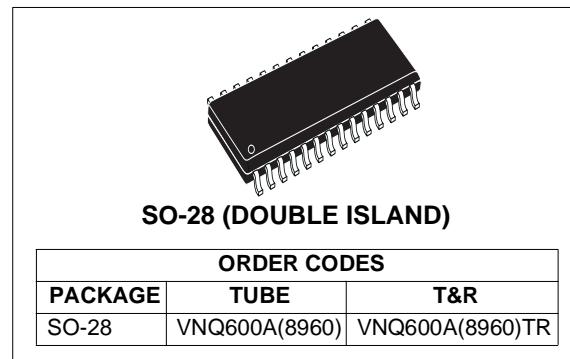

TYPE	R <sub>DS(on)</sub> (*)	I <sub>lim</sub>	V <sub>CC</sub>
VNQ600A(8960)	30mΩ	25A	36 V

(\*) Per each channel at V<sub>CC</sub>=13V

- DC SHORT CIRCUIT CURRENT: 25A
- CMOS COMPATIBLE INPUTS
- PROPORTIONAL LOAD CURRENT SENSE
- UNDERVOLTAGE & OVERVOLTAGE SHUT-DOWN
- OVERVOLTAGE CLAMP
- THERMAL SHUT-DOWN
- CURRENT LIMITATION
- VERY LOW STAND-BY POWER DISSIPATION
- PROTECTION AGAINST:
  - LOSS OF GROUND & LOSS OF V<sub>CC</sub>
- REVERSE BATTERY PROTECTION (\*\*)

### DESCRIPTION

The VNQ600A(8960) is a quad HSD formed by assembling two VND600 chips in the same SO-28

**SO-28 (DOUBLE ISLAND)**

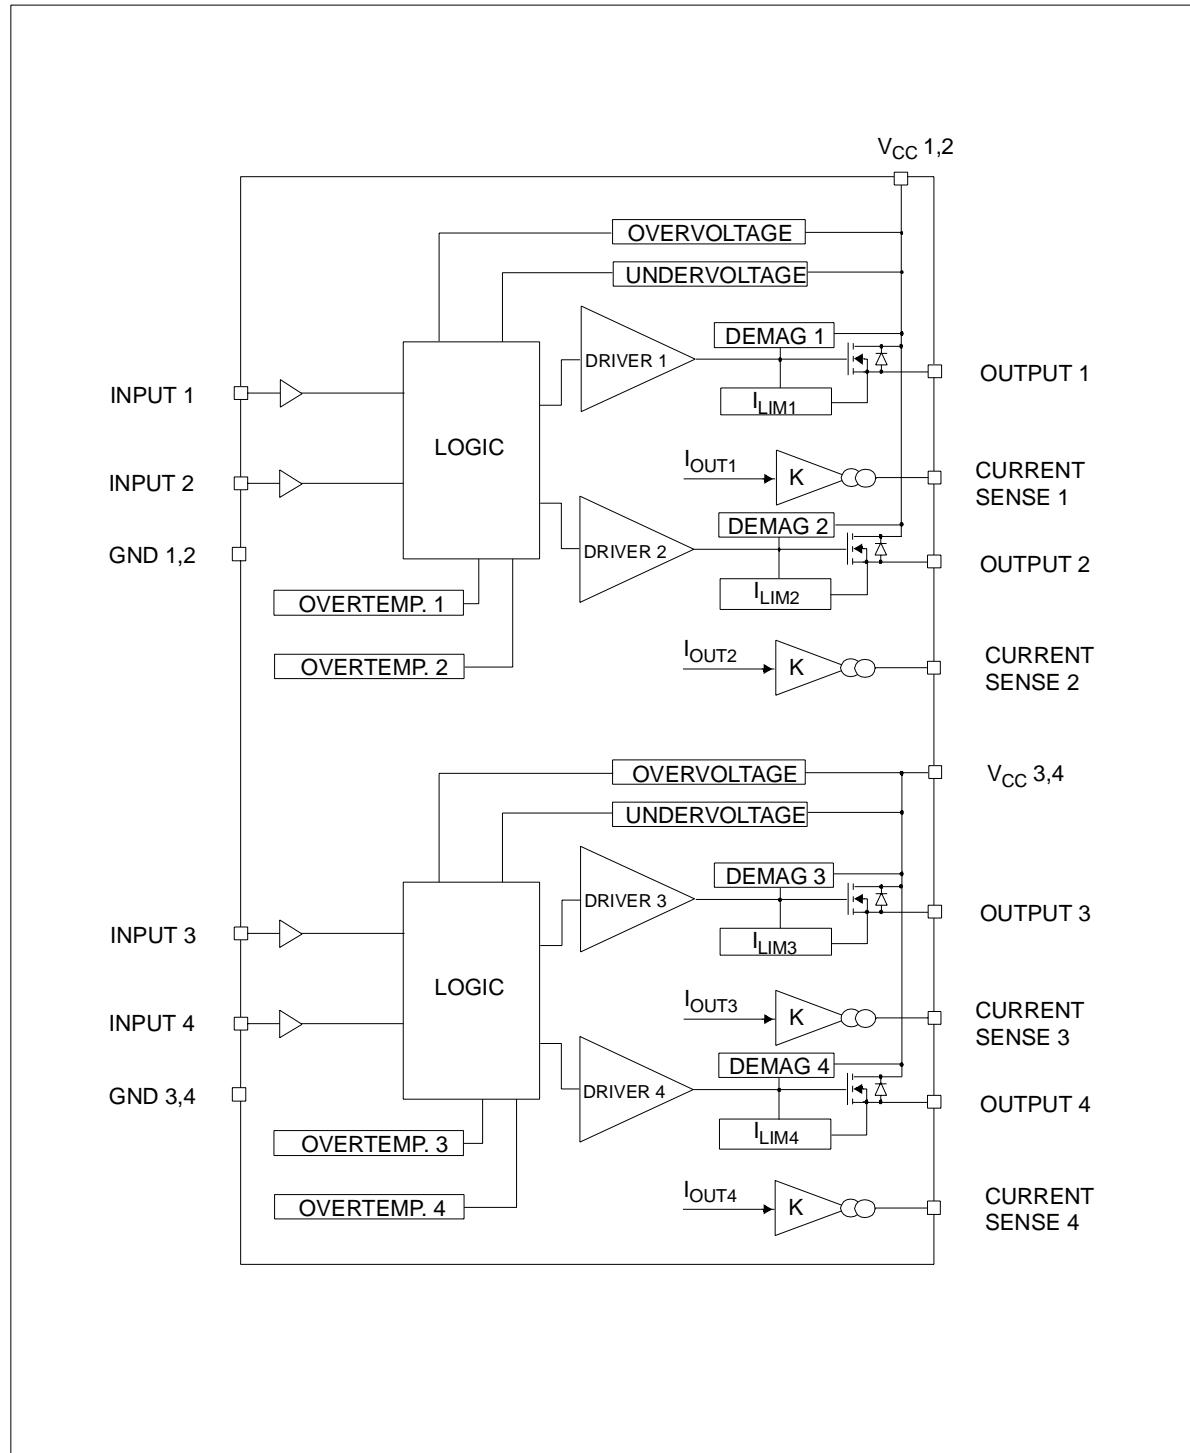

ORDER CODES		
PACKAGE	TUBE	T&R
SO-28	VNQ600A(8960)	VNQ600A(8960)TR

package. The VND600 is a monolithic device designed in STMicroelectronics VIPower M0-3 Technology. The VNQ600A(8960) is intended for driving any type of multiple loads with one side connected to ground. This device has four independent channels and four analog sense outputs which deliver currents proportional to the outputs currents. Active current limitation combined with thermal shut-down and automatic restart protect the device against overload. Device automatically turns off in case of ground pin disconnection.

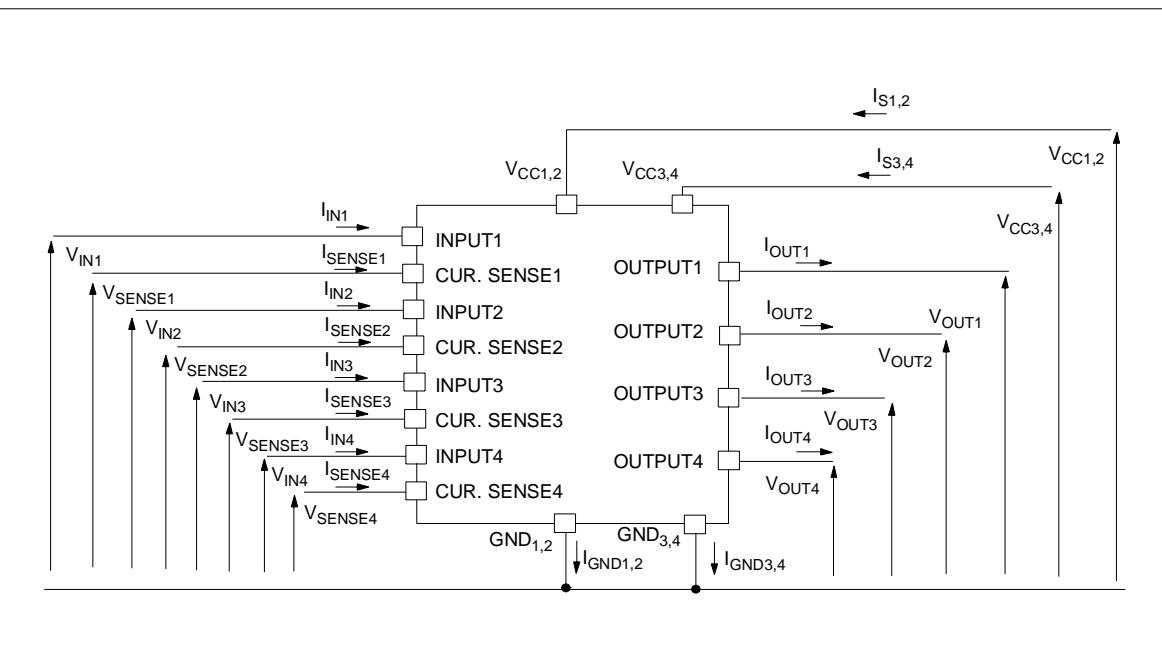

### ABSOLUTE MAXIMUM RATING

Symbol	Parameter	Value	Unit
V <sub>CC</sub>	Supply voltage (continuous)	41	V
-V <sub>CC</sub>	Reverse supply voltage (continuous)	-0.3	V
I <sub>OUT</sub>	Output current (continuous), for each channel	15	A
I <sub>R</sub>	Reverse output current (continuous), for each channel	-15	A
I <sub>IN</sub>	Input current	+/- 10	mA
V <sub>CSENSE</sub>	Current sense maximum voltage	-3 +15	V
I <sub>GND</sub>	Ground current at T <sub>pins</sub> ≤ 25°C (continuous)	-200	mA
V <sub>ESD</sub>	Electrostatic Discharge (Human Body Model: R=1.5KΩ; C=100pF)		
	- INPUT	4000	V
	- CURRENT SENSE	2000	V
	- OUTPUT	5000	V
E <sub>MAX</sub>	- V <sub>CC</sub>	5000	V
	Maximum Switching Energy (L=0.11mH; R <sub>L</sub> =0Ω; V <sub>bat</sub> =13.5V; T <sub>jstart</sub> =150°C; I <sub>L</sub> =40A)	126	mJ
P <sub>tot</sub>	Power dissipation (per island) at T <sub>lead</sub> =25°C	6.25	W
T <sub>j</sub>	Junction operating temperature	Internally Limited	°C
T <sub>stg</sub>	Storage temperature	-55 to 150	°C

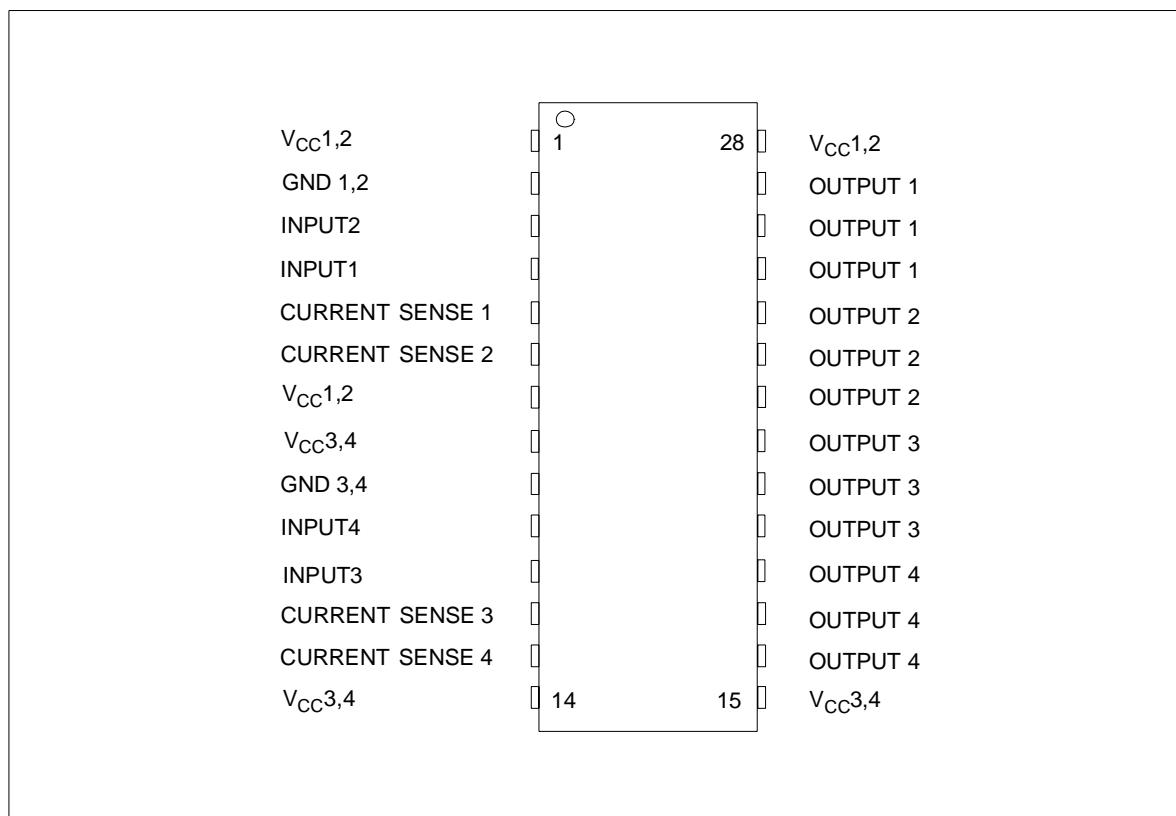

(\*\*) See application schematic at page 9.

Class	Contents
C	All functions of the device are performed as designed after exposure to disturbance.
E	One or more functions of the device is not performed as designed after exposure and cannot be returned to proper operation without replacing the device.

Figure 1: Switching Characteristics (Resistive load  $R_L=2.6\Omega$ )

**Figure 2:** Waveforms (per each chip)

## APPLICATION SCHEMATIC

### GND PROTECTION NETWORK AGAINST REVERSE BATTERY

Solution 1: Resistor in the ground line ( $R_{GND}$  only). This can be used with any type of load.

The following is an indication on how to dimension the  $R_{GND}$  resistor.

- 1)  $R_{GND} \leq 600\text{mV} / 2(I_{S(on)\max})$
- 2)  $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where  $-I_{GND}$  is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device's datasheet.

Power Dissipation in  $R_{GND}$  (when  $V_{CC} < 0$ : during reverse battery situations) is:

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSD. Please note that the value of this resistor should be calculated with formula (1) where  $I_{S(on)\max}$  becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not common with the device ground then the  $R_{GND}$  will produce a shift ( $I_{S(on)\max} * R_{GND}$ ) in the input thresholds

and the status output values. This shift will vary depending on how many devices are ON in the case of several high side drivers sharing the same  $R_{GND}$ .

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then the ST suggests to utilize Solution 2 (see below).

Solution 2: A diode ( $D_{GND}$ ) in the ground line.

A resistor ( $R_{GND}=1\text{k}\Omega$ ) should be inserted in parallel to  $D_{GND}$  if the device will be driving an inductive load.

This small signal diode can be safely shared amongst several different HSD. Also in this case, the presence of the ground network will produce a shift ( $\approx 600\text{mV}$ ) in the input threshold and the status output values if the microprocessor ground is not common with the device ground. This shift will not vary if more than one HSD shares the same diode/resistor network.

### LOAD DUMP PROTECTION

$D_{Id}$  is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds  $V_{CC}$  max DC rating. The same applies if the device will be subject to transients on the  $V_{CC}$  line that are greater than the ones shown in the ISO T/R 7637/1 table.

**$\mu$ C I/Os PROTECTION:**

If a ground protection network is used and negative transients are present on the  $V_{CC}$  line, the control pins will be pulled negative. ST suggests to insert a resistor ( $R_{prot}$ ) in line to prevent the  $\mu$ C I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of  $\mu$ C and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of  $\mu$ C I/Os.

$$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

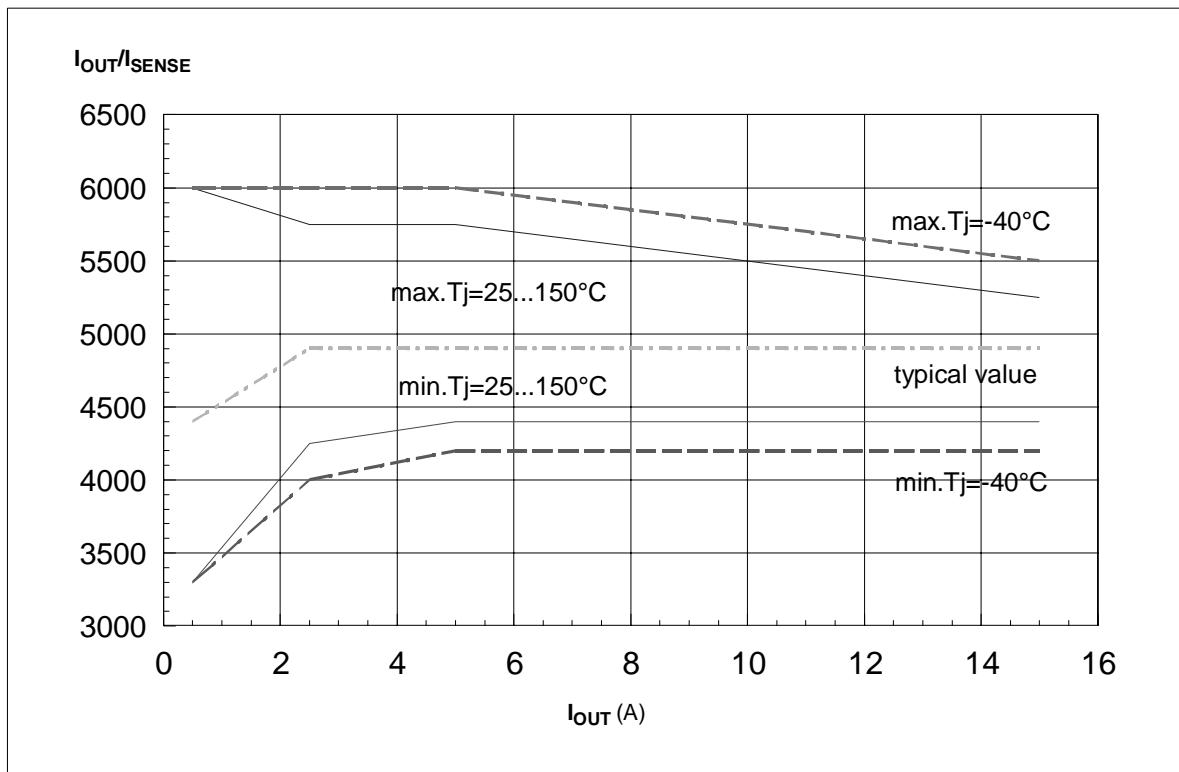

Calculation example:

For  $V_{CCpeak} = -100V$  and  $I_{latchup} \geq 20mA$ ;  $V_{OH\mu C} \geq 4.5V$

$$5k\Omega \leq R_{prot} \leq 6k\Omega$$

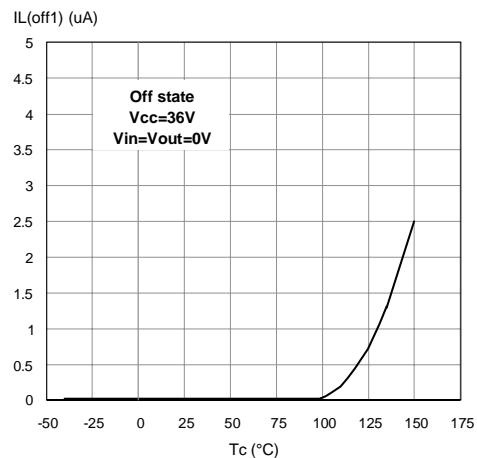

Recommended  $R_{prot}$  value is  $5k\Omega$ .
