

## Smart Two Channel Highside Power Switch

### Features

- Overload protection
- Current limitation
- Short circuit protection
- Thermal shutdown
- Overtoltage protection (including load dump)
- Fast demagnetization of inductive loads
- Reverse battery protection<sup>1)</sup>
- Undervoltage and overvoltage shutdown with auto-restart and hysteresis
- Open drain diagnostic output
- Open load detection in ON-state
- CMOS compatible input
- Loss of ground and loss of  $V_{bb}$  protection
- Electrostatic discharge (ESD) protection

### Application

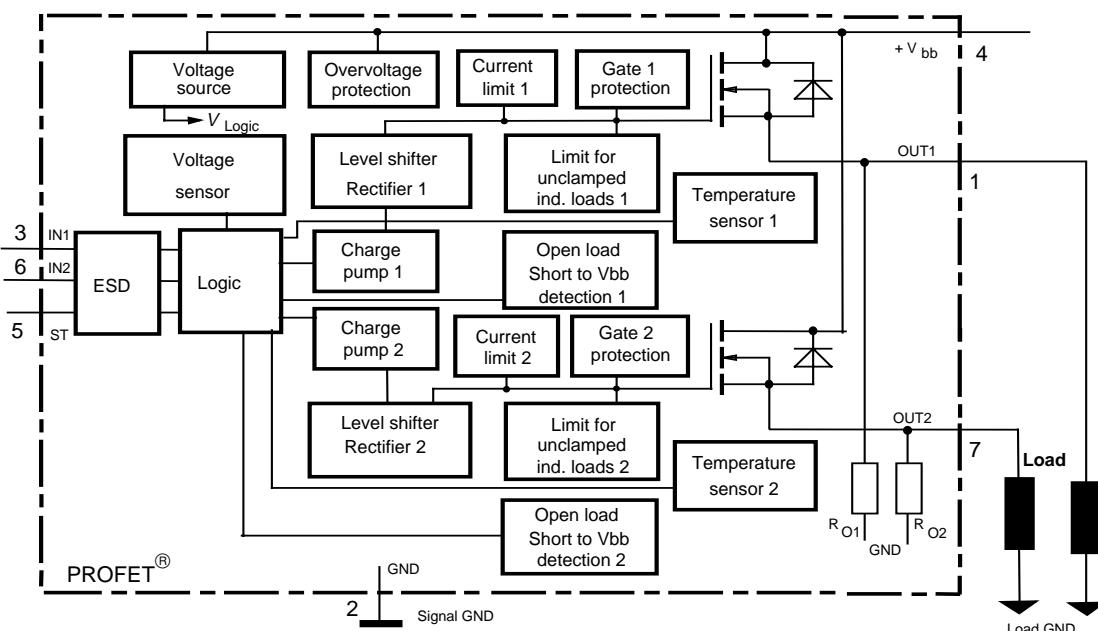

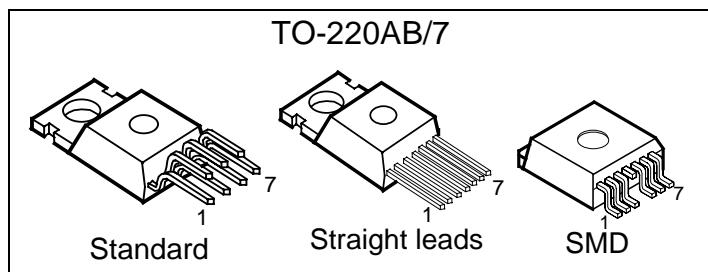

- µC compatible power switch with diagnostic feedback for 12 V and 24 V DC grounded loads
- All types of resistive, inductive and capacitive loads
- Replaces electromechanical relays, fuses and discrete circuits

### General Description

N channel vertical power FET with charge pump, ground referenced CMOS compatible input and diagnostic feedback, monolithically integrated in Smart SIPMOS® technology. Fully protected by embedded protection functions.

### Product Summary

Overtoltage protection	$V_{bb(AZ)}$	43	V
Operating voltage	$V_{bb(on)}$	5.0 ... 34	V
	channels:	each	both parallel
On-state resistance	$R_{ON}$	200	100 mΩ
Load current (ISO)	$I_{L(ISO)}$	2.3	4.4 A
Current limitation	$I_{L(SCr)}$	4	4 A

1) With external current limit (e.g. resistor  $R_{GND}=150 \Omega$ ) in GND connection, resistor in series with ST connection, reverse load current limited by connected load.

Pin	Symbol	Function
1	OUT1 (Load, L)	Output 1, protected high-side power output of channel 1
2	GND	Logic ground
3	IN1	Input 1, activates channel 1 in case of logical high signal
4	Vbb	Positive power supply voltage, the tab is shorted to this pin
5	ST	Diagnostic feedback: open drain, low on failure
6	IN2	Input 2, activates channel 2 in case of logical high signal
7	OUT2 (Load, L)	Output 2, protected high-side power output of channel 2

- 
- 2) Supply voltages higher than  $V_{bb(AZ)}$  require an external current limit for the GND and status pins, e.g. with a  $150\ \Omega$  resistor in the GND connection and a  $15\text{ k}\Omega$  resistor in series with the status pin. A resistor for the protection of the input is integrated.
- 3)  $R_l$  = internal resistance of the load dump test pulse generator
- 4)  $V_{Load\ dump}$  is setup without the DUT connected to the generator per ISO 7637-1 and DIN 40839

<sup>9)</sup> Requires 150  $\Omega$  resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 2 and circuit page 8).

<sup>10)</sup> External pull up resistor required for open load detection in off state.

## Terms

## Input circuit (ESD protection)

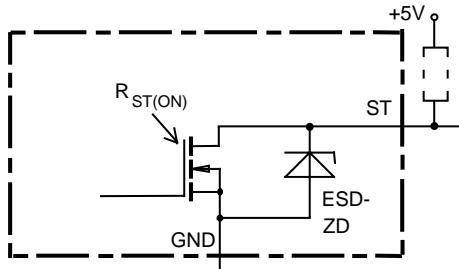

ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

12) With additional external pull up resistor

13) An external short of output to  $V_{bb}$ , in the off state, causes an internal current from output to ground. If  $R_{GND}$  is used, an offset voltage at the GND and ST pins will occur and the  $V_{ST\ low}$  signal may be erroneous.

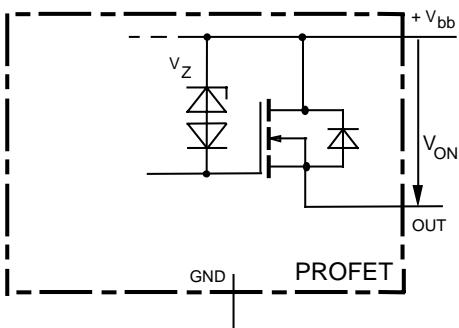

14) Low resistance to  $V_{bb}$  may be detected in the ON-state by the no-load-detection

## Status output

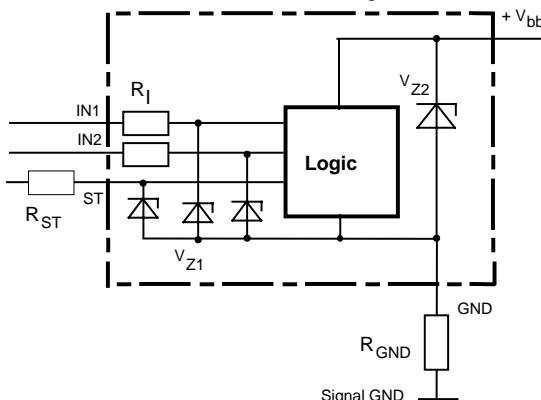

ESD-Zener diode: 6.1 V typ., max 5 mA;  
 $R_{ST(ON)} < 380 \Omega$  at 1.6 mA, ESD zener diodes are not to be used as voltage clamp at DC conditions.  
 Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

## Inductive and overvoltage output clamp

$V_{ON}$  clamped to 47 V typ.

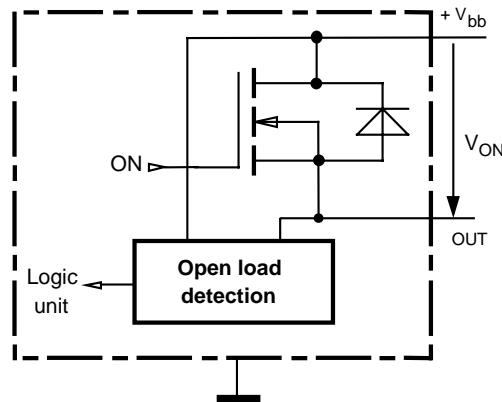

## Overvolt. and reverse batt. protection

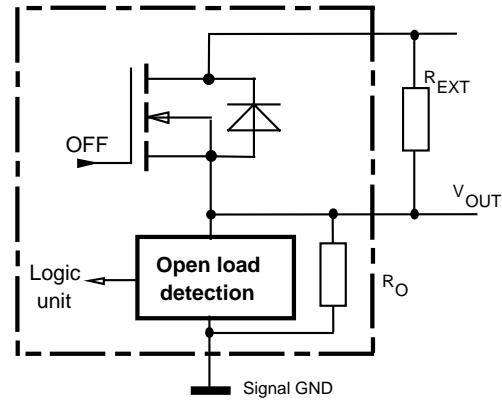

$V_{Z1} = 6.1$  V typ.,  $V_{Z2} = 47$  V typ.,  $R_I = 3.5 \text{ k}\Omega$  typ,  
 $R_{GND} = 150 \Omega$

## Open-load detection

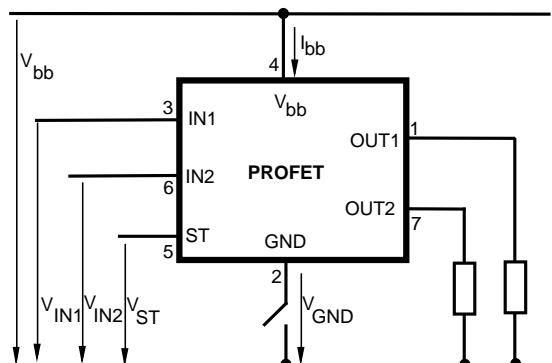

ON-state diagnostic condition:  $V_{ON} < R_{ON} * I_{L(OL)}$ ; IN high

OFF-state diagnostic condition:  $V_{OUT} > 3$  V typ.; IN low

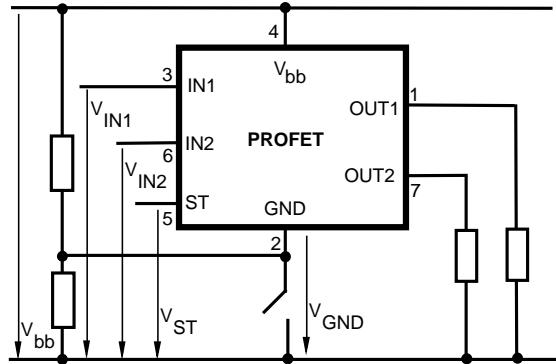

## GND disconnect

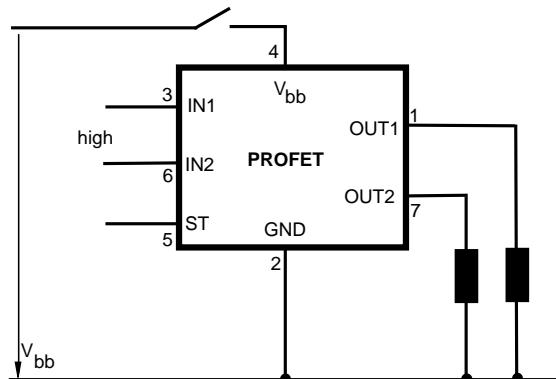

Any kind of load. In case of Input=high is  $V_{OUT} \approx V_{IN} - V_{IN(T+)}$ . Due to  $V_{GND} > 0$ , no  $V_{ST} = \text{low}$  signal available.

## GND disconnect with GND pull up

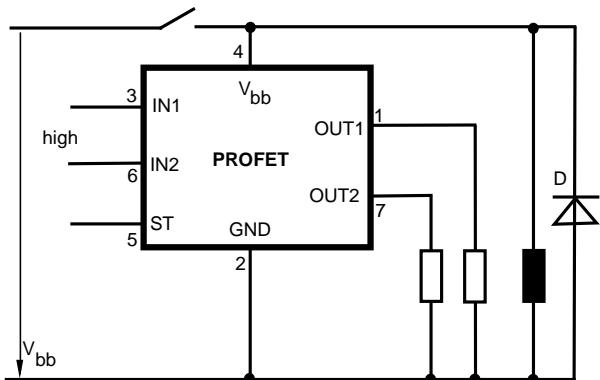

Any kind of load. If  $V_{GND} > V_{IN} - V_{IN(T+)}$  device stays off  
Due to  $V_{GND} > 0$ , no  $V_{ST} = \text{low signal available}$ .

## V<sub>bb</sub> disconnect with energized inductive load

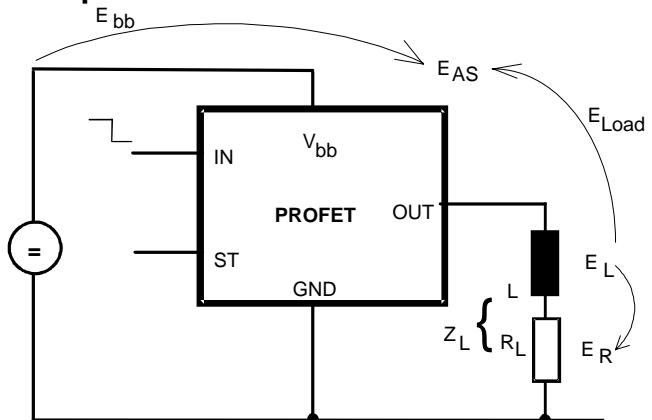

Normal load current can be handled by the PROFET itself.

## V<sub>bb</sub> disconnect with charged external inductive load

If other external inductive loads L are connected to the PROFET, additional elements like D are necessary.

## Inductive Load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = \frac{1}{2} \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for  $R_L > 0 \Omega$ :

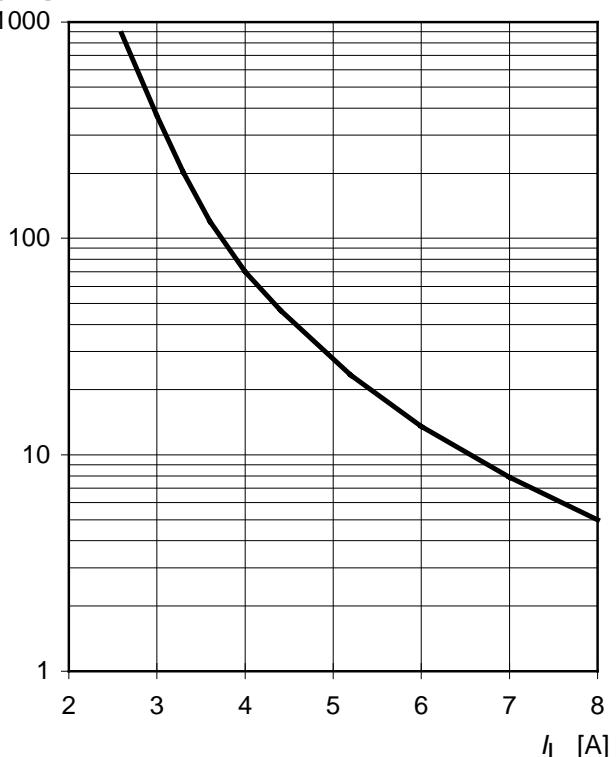

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} \cdot (V_{bb} + |V_{OUT(CL)}|) \cdot \ln \left( 1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$

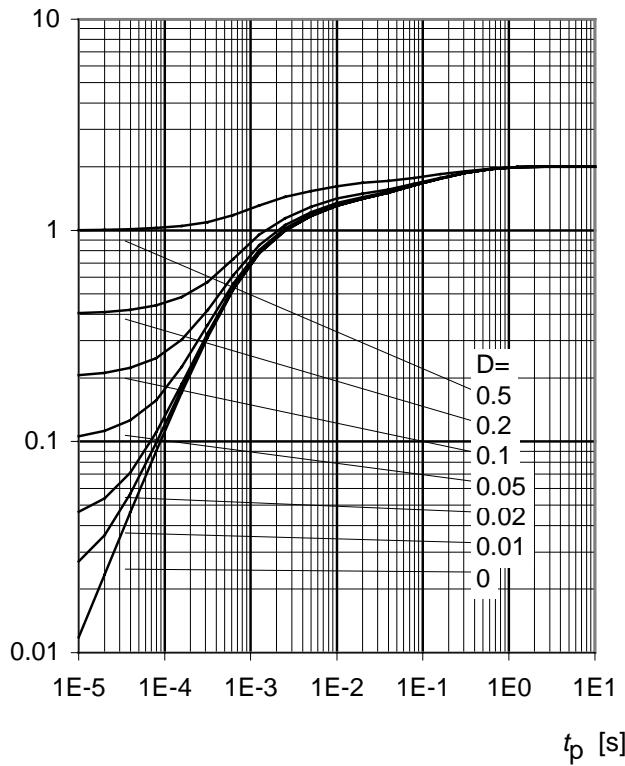

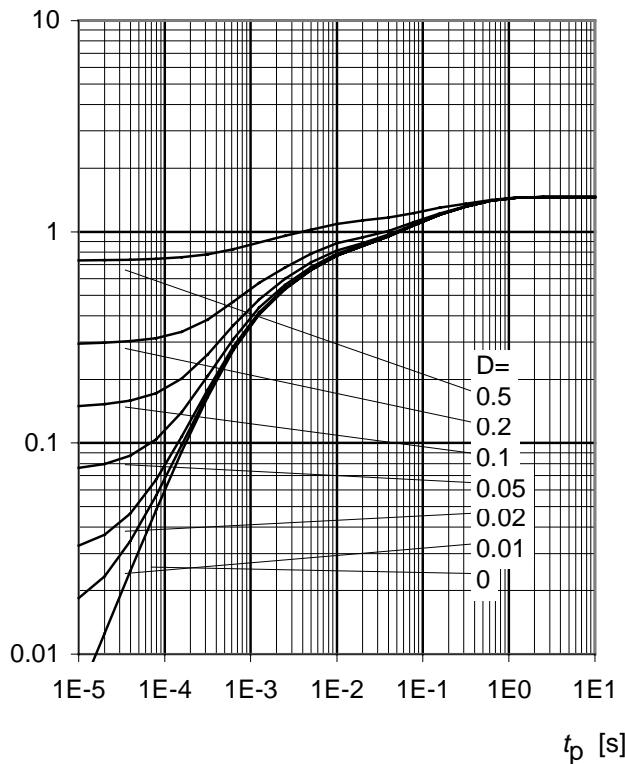

## Maximum allowable load inductance for a single switch off (both channels parallel)

$L = f(I_L)$ ;  $T_{j,start} = 150^\circ\text{C}$ ,  $T_C = 150^\circ\text{C}$  const.,

$V_{bb} = 12 \text{ V}$ ,  $R_L = 0 \Omega$

$L$  [mH]
