

Micropower Regulator and Comparator

FEATURES

- 40 μ A Supply Current
- 125mA Output Current
- 2.5V Reference Voltage
- Reference Output Sources 1mA and Sinks 0.5mA
- Dual Output Comparator
- Comparator Sinks 10mA
- Dropout Detector
- 0.2V Dropout Voltage
- Thermal Limiting
- Electrical Shutdown

APPLICATIONS

- Battery Systems
- Battery Backup System
- Portable Terminals
- Portable Instruments

DESCRIPTION

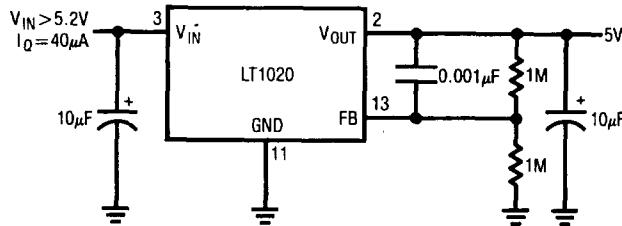

The LT1020 is a combination micropower positive regulator and free collector comparator on a single monolithic chip. With only 40 μ A supply current, the LT1020 can supply over 125mA of output current. Input voltage range is from 4.5V to 36V and dropout voltage is 0.6V at 125mA. Dropout voltage decreases with lower load currents. Also included on the chip is a class B output 2.5V reference that can either source or sink current. A dropout detector provides an output current to indicate when the regulator is about to drop out of regulation.

The dual output comparator can be used as a comparator for system or battery monitoring. For example, the comparator can be used to warn of low system voltage while the dropout detector shuts down the system to prevent abnormal operation. Frequency compensation of the comparator for amplifier applications can be obtained by adding external output capacitance. Dual output or positive and negative regulators can also be made.

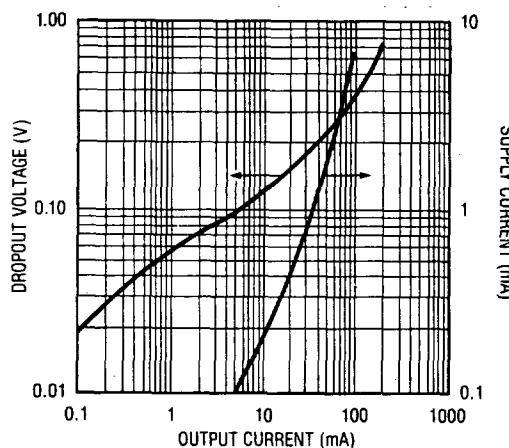

The 2.5V reference will source or sink current. This allows it to be used as a supply splitter or auxiliary output.

5V Regulator

Dropout Voltage and Supply Current

ABSOLUTE MAXIMUM RATINGS

Input Voltage	36V
NPN Collector Voltage	36V
PNP Collector Voltage	Supply - 36V
Output Short Circuit Duration	Indefinite
Power Dissipation	Internally Limited
Operating Temperature Range	0°C to 100°C
Storage Temperature Range	-65°C to 150°C

The ● denotes the specifications which apply over full operating temperature range.

Note 1: For $0V \leq V_{CM} \leq 0.1V$ and $T > 85^\circ\text{C}$ bias max is 100nA.

PIN FUNCTIONS

Pins 1, 8, 9, 16—No internal connection.

Pin 2—**Regulator Output.** Main output, requires $10\mu F$ output capacitor. Can be shorted to V_{IN} or ground without damaging device.

Pin 3—**Input Supply.** Bypass with $10\mu F$ cap. Must always be more positive than ground.

Pin 4—**Reference.** 2.5V can source or sink current. May be shorted to ground or up to 5V. Voltages in excess of 5V can damage the device.

Pin 5—**Comparator PNP Output.** Pull up current source for the comparator. May be connected to any voltage from V_{IN} to 36V more negative than V_{IN} (operates below ground).

Short circuit protected. For example, if V_{IN} is 6V then pin 5 will operate to $-30V$.

Pin 6—**Comparator NPN Output.** May be connected to any voltage from ground to 36V more positive than ground (operates above V_{IN}). Short circuit protected.

Pins 7, 10—**Comparator Inputs.** Operates from ground to $V_{IN} - 1V$. Comparator inputs will withstand 36V even with V_{IN} of 0V.

Pin 11—**Ground.**

Pin 12—**Current Limit.** Connecting this pin to ground decreases the regulator current limit to 3mA min. Leave open when not used.

Pin 13—**Feedback.** This is the feedback point of the regulator. When operating, it is nominally at 2.5V. Optimum source resistance is 200k to 500k. The feedback pin should not be driven below ground or more positive than 5V.

Pin 14—**Shutdown.** Logic high turns the regulator output off. Shutdown threshold is 1.4V and impedance is $65k\Omega$.

Pin 15—**Dropout Detector.** This pin acts like a current source from V_{IN} which turns on when the output transistor goes into saturation. The magnitude of the current depends on the magnitude of the output current and the input-output voltage differential. Pin current ranges from $5\mu A$ to about $300\mu A$.
