

250mA/60MHz Current Feedback Amplifier

FEATURES

- 250mA Minimum Output Drive Current
- 60MHz Bandwidth, $A_V = 2$, $R_I = 100\Omega$
- 900V/ μ s Slew Rate, A_V = 2, R_L = 50 Ω
- 0.02% Differential Gain, $A_V = 2$, $R_L = 30\Omega$
- 0.17° Differential Phase, $A_V = 2$, $R_I = 30\Omega$
- High Input Impedance, $10M\Omega$
- Wide Supply Range, ±5V to ±15V
- Shutdown Mode: I_S < 200µA
- Adjustable Supply Current
- Stable with $C_L = 10,000pF$

APPLICATIONS

- Video Amplifiers
- Cable Drivers
- RGB Amplifiers
- Test Equipment Amplifiers
- Buffers

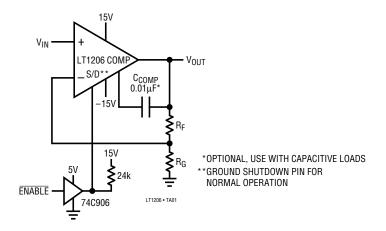

DESCRIPTION

The LT1206 is a current feedback amplifier with high output current drive capability and excellent video characteristics. The LT1206 is stable with large capacitive loads, and can easily supply the large currents required by the capacitive loading. A shutdown feature switches the device into a high impedance, low current mode, reducing dissipation when the device is not in use. For lower bandwidth applications, the supply current can be reduced with a single external resistor. The low differential gain and phase, wide bandwidth, and the 250mA minimum output current drive make the LT1206 well suited to drive multiple cables in video systems.

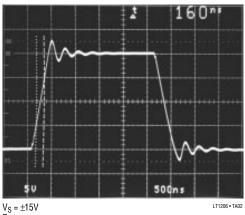

The LT1206 is manufactured on Linear Technology's proprietary complementary bipolar process.

TYPICAL APPLICATIONS

Noninverting Amplifier with Shutdown

Large-Signal Response, $C_L = 10,000pF$

 $V_S = \pm 15V$ $R_L = \infty$

 $R_F = R_G = 3k$

ABSOLUTE MAXIMUM RATINGS

Supply Voltage	±18V
Input Current	±15mA
Output Short-Circuit Duration (Note 1)	Continuous
Specified Temperature Range (Note 2)	0°C to 70°C

Operating Temperature Range	
LT1206C	40°C to 85°C
Junction Temperature	150°C
Storage Temperature Range	– 65°C to 150°C
Lead Temperature (Soldering, 10 sec	c) 300°C

PACKAGE/ORDER INFORMATION

^{*}Ground shutdown pin for normal operation

ELECTRICAL CHARACTERISTICS V_{CM} = 0, $\pm 5V \le V_S \le \pm 15V$, pulse tested, $V_{S/D}$ = 0V, unless otherwise noted.

The ullet denotes specifications which apply for $0^{\circ}C \leq T_A \leq 70^{\circ}C$.

Note 1: Applies to short circuits to ground only. A short circuit between the output and either supply may permanently damage the part when operated on supplies greater than ± 10 V.

Note 2: Commercial grade parts are designed to operate over the temperature range of -40°C to 85°C but are neither tested nor guaranteed

beyond 0°C to 70°C. Industrial grade parts tested over -40°C to 85°C are available on special request. Consult factory.

Note 3: $R_{S/D}$ is connected between the shutdown pin and ground.

Note 4: Slew rate is measured at $\pm 5V$ on a $\pm 10V$ output signal while operating on $\pm 15V$ supplies with $R_F=1.5k$, $R_G=1.5k$ and $R_L=400\Omega$.

Note 5: NTSC composite video with an output level of 2V.

SIMPLIFIED SCHEMATIC

APPLICATIONS INFORMATION

The LT1206 is a current feedback amplifier with high output current drive capability. The device is stable with large capacitive loads and can easily supply the high currents required by capacitive loads. The amplifier will drive low impedance loads such as cables with excellent linearity at high frequencies.

Feedback Resistor Selection

The optimum value for the feedback resistors is a function of the operating conditions of the device, the load impedance and the desired flatness of response. The Typical AC Performance tables give the values which result in the highest 0.1dB and 0.5dB bandwidths for various resistive loads and operating conditions. If this level of flatness is not required, a higher bandwidth can be obtained by use of a lower feedback resistor. The characteristic curves of Bandwidth vs Supply Voltage indicate feedback resistors for peaking up to 5dB. These curves use a solid line when the response has less than 0.5dB of peaking and a dashed

line when the response has 0.5dB to 5dB of peaking. The curves stop where the response has more than 5dB of peaking.

For resistive loads, the COMP pin should be left open (see section on capacitive loads).

Capacitive Loads

The LT1206 includes an optional compensation network for driving capacitive loads. This network eliminates most of the output stage peaking associated with capacitive loads, allowing the frequency response to be flattened. Figure 1 shows the effect of the network on a 200pF load. Without the optional compensation, there is a 5dB peak at 40MHz caused by the effect of the capacitance on the output stage. Adding a $0.01\mu F$ bypass capacitor between the output and the COMP pins connects the compensation and completely eliminates the peaking. A lower value feedback resistor can now be used, resulting in a response

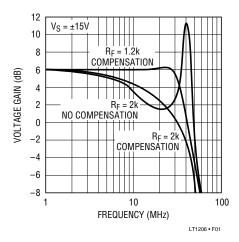

Figure 1.

which is flat to 0.35dB to 30MHz. The network has the greatest effect for C_L in the range of 0pF to 1000pF. The graph of Maximum Capacitive Load vs Feedback Resistor can be used to select the appropriate value of feedback resistor. The values shown are for 0.5dB and 5dB peaking at a gain of 2 with no resistive load. This is a worst case condition, as the amplifier is more stable at higher gains and with some resistive load in parallel with the capacitance. Also shown is the -3dB bandwidth with the suggested feedback resistor vs the load capacitance.

Although the optional compensation works well with capacitive loads, it simply reduces the bandwidth when it is connected with resistive loads. For instance, with a 30Ω load, the bandwidth drops from 55MHz to 35MHz when the compensation is connected. Hence, the compensation was made optional. To disconnect the optional compensation, leave the COMP pin open.

Shutdown/Current Set

If the shutdown feature is not used, the SHUTDOWN pin must be connected to ground or V^- .

The shutdown pin can be used to either turn off the biasing for the amplifier, reducing the quiescent current to less than 200µA, or to control the quiescent current in normal operation.

The total bias current in the LT1206 is controlled by the current flowing out of the shutdown pin. When the shutdown pin is open or driven to the positive supply, the part is shut down. In the shutdown mode, the output looks like

a 40pF capacitor and the supply current is typically $100\mu A$. The shutdown pin is referenced to the positive supply through an internal bias circuit (see the simplified schematic). An easy way to force shutdown is to use open drain (collector) logic. The circuit shown in Figure 2 uses a 74C904 buffer to interface between 5V logic and the LT1206. The switching time between the active and shutdown states is less than $1\mu s$. A 24k pull-up resistor speeds up the turn-off time and insures that the LT1206 is completely turned off. Because the pin is referenced to the positive supply, the logic used should have a breakdown voltage of greater than the positive supply voltage. No other circuitry is necessary as the internal circuit limits the shutdown pin current to about $500\mu A$. Figure 3 shows the resulting waveforms.

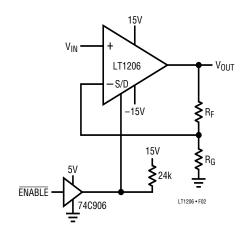

Figure 2. Shutdown Interface

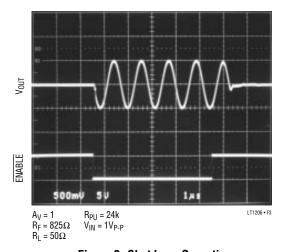

Figure 3. Shutdown Operation

For applications where the full bandwidth of the amplifier is not required, the quiescent current of the device may be reduced by connecting a resistor from the shutdown pin to ground. The quiescent current will be approximately 40 times the current in the shutdown pin. The voltage across the resistor in this condition is $V^+ - 3V_{BE}$. For example, a 60k resistor will set the quiescent supply current to 10mA with $V_S = \pm 15V$.

The photos (Figures 4a and 4b) show the effect of reducing the quiescent supply current on the large-signal response. The quiescent current can be reduced to 5mA in the inverting configuration without much change in response. In noninverting mode, however, the slew rate is reduced as the quiescent current is reduced.

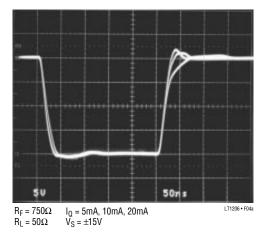

Figure 4a. Large-Signal Response vs I_0 , $A_V = -1$

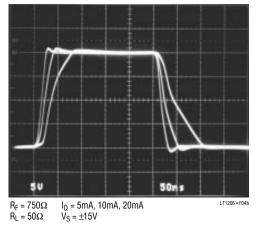

Figure 4b. Large-Signal Response vs I_0 , $A_V = 2$

Slew Rate

Unlike a traditional op amp, the slew rate of a current feedback amplifier is not independent of the amplifier gain configuration. There are slew rate limitations in both the input stage and the output stage. In the inverting mode, and for higher gains in the noninverting mode, the signal amplitude on the input pins is small and the overall slew rate is that of the output stage. The input stage slew rate is related to the quiescent current and will be reduced as the supply current is reduced. The output slew rate is set by the value of the feedback resistors and the internal capacitance. Larger feedback resistors will reduce the slew rate as will lower supply voltages, similar to the way the bandwidth is reduced. The photos (Figures 5a, 5b and 5c) show the large-signal response of the LT1206 for various gain configurations. The slew rate varies from 860V/ μ s for a gain of 1, to 1400V/ μ s for a gain of -1.

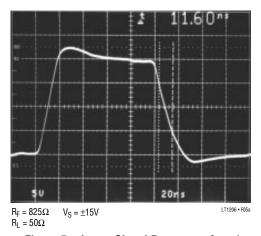

Figure 5a. Large-Signal Response, $A_V = 1$

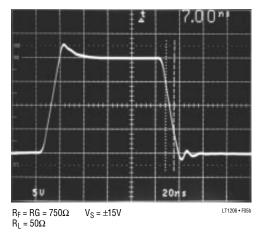

Figure 5b. Large-Signal Response, $A_V = -1$

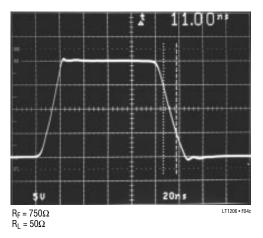

Figure 5c. Large-Signal Response, $A_V = 2$

When the LT1206 is used to drive capacitive loads, the available output current can limit the overall slew rate. In the fastest configuration, the LT1206 is capable of a slew rate of over 1V/ns. The current required to slew a capacitor at this rate is 1mA per picofarad of capacitance, so 10,000pF would require 10A! The photo (Figure 6) shows the large signal behavior with $C_L = 10,000pF$. The slew rate is about $60V/\mu s$, determined by the current limit of 600mA.

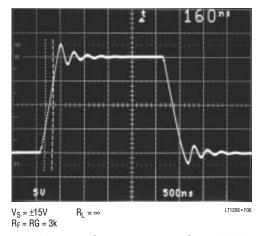

Figure 6. Large-Signal Response, $C_1 = 10,000pF$

Differential Input Signal Swing

The differential input swing is limited to about $\pm 6V$ by an ESD protection device connected between the inputs. In normal operation, the differential voltage between the input pins is small, so this clamp has no effect; however, in the shutdown mode the differential swing can be the same as the input swing. The clamp voltage will then set

the maximum allowable input voltage. To allow for some margin, it is recommended that the input signal be less than $\pm 5V$ when the device is shut down.

Capacitance on the Inverting Input

Current feedback amplifiers require resistive feedback from the output to the inverting input for stable operation. Take care to minimize the stray capacitance between the output and the inverting input. Capacitance on the inverting input to ground will cause peaking in the frequency response (and overshoot in the transient response), but it does not degrade the stability of the amplifier.

Power Supplies

The LT1206 will operate from single or split supplies from $\pm 5V$ (10V total) to $\pm 15V$ (30V total). It is not necessary to use equal value split supplies, however the offset voltage and inverting input bias current will change. The offset voltage changes about $500\mu V$ per volt of supply mismatch. The inverting bias current can change as much as $5\mu A$ per volt of supply mismatch, though typically the change is less than $0.5\mu A$ per volt.

Thermal Considerations

The LT1206 contains a thermal shutdown feature which protects against excessive internal (junction) temperature. If the junction temperature of the device exceeds the protection threshold, the device will begin cycling between normal operation and an off state. The cycling is not harmful to the part. The thermal cycling occurs at a slow rate, typically 10ms to several seconds, which depends on the power dissipation and the thermal time constants of the package and heat sinking. Raising the ambient temperature until the device begins thermal shutdown gives a good indication of how much margin there is in the thermal design.

For surface mount devices heat sinking is accomplished by using the heat spreading capabilities of the PC board and its copper traces. Experiments have shown that the heat spreading copper layer does not need to be electrically connected to the tab of the device. The PCB material can be very effective at transmitting heat between the pad area attached to the tab of the device, and a ground or

power plane layer either inside or on the opposite side of the board. Although the actual thermal resistance of the PCB material is high, the length/area ratio of the thermal resistance between the layer is small. Copper board stiffeners and plated through holes can also be used to spread the heat generated by the device.

Tables 1 and 2 list thermal resistance for each package. For the TO-220 package, thermal resistance is given for junction-to-case only since this package is usually mounted to a heat sink. Measured values of thermal resistance for several different board sizes and copper areas are listed for each surface mount package. All measurements were taken in still air on 3/32" FR-4 board with 1oz copper. This data can be used as a rough guideline in estimating thermal resistance. The thermal resistance for each application will be affected by thermal interactions with other components as well as board size and shape.

Calculating Junction Temperature

The junction temperature can be calculated from the equation:

$$T_{J} = (P_D \times \theta_{JA}) + T_A$$

where:

 $T_J = Junction Temperature$

T_A = Ambient Temperature

P_D = Device Dissipation

 θ_{JA} = Thermal Resistance (Junction-to Ambient)

As an example, calculate the junction temperature for the circuit in Figure 7 for the N8, S8, and R packages assuming a 70° C ambient temperature.

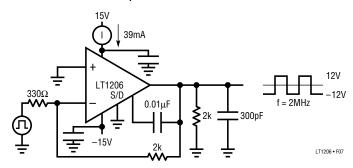

Figure 7. Thermal Calculation Example

The device dissipation can be found by measuring the supply currents, calculating the total dissipation, and then subtracting the dissipation in the load and feedback network.

$$P_D = (39\text{mA} \times 30\text{V}) - (12\text{V})^2/(2\text{kll2k}) = 1.03\text{W}$$

Then:

$$T_J = (1.03W \times 100^{\circ}C/W) + 70^{\circ}C = 173^{\circ}C$$
 for the N8 package

$$T_J = (1.03W \times 65^{\circ}C/W) \times + 70^{\circ}C = 137^{\circ}C$$

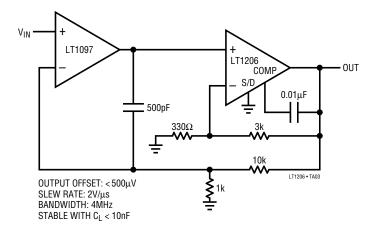

for the S8 with 225 sq. mm topside heat sinking

$$T_J = (1.03W \times 35^{\circ}C/W) \times + 70^{\circ}C = 106^{\circ}C$$
 for the R package with 100 sq. mm topside heat sinking

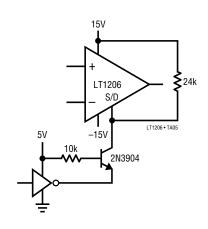

Since the Maximum Junction Temperature is 150°C, the N8 package is clearly unacceptable. Both the S8 and R packages are usable.

TYPICAL APPLICATIONS

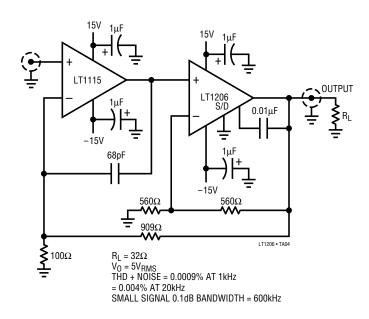

Precision ×10 Hi Current Amplifier

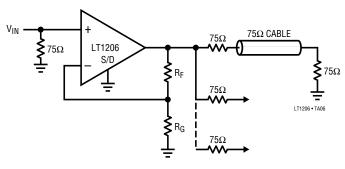

CMOS Logic to Shutdown Interface

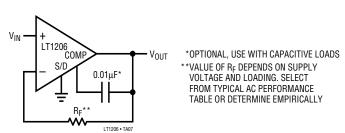

Low Noise ×10 Buffered Line Driver

Distribution Amplifier

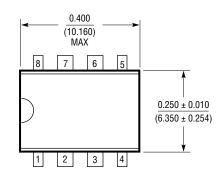

Buffer $A_V = 1$

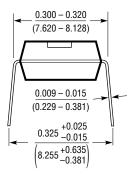

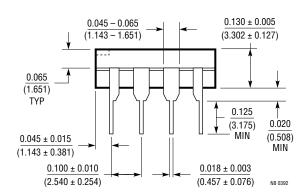

PACKAGE DESCRIPTION Dimensions in inches (millimeters) unless otherwise noted.

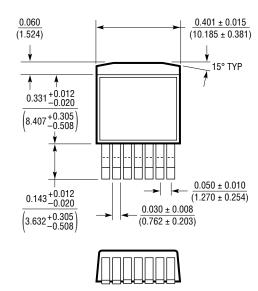

N8 Package 8-Lead Plastic DIP

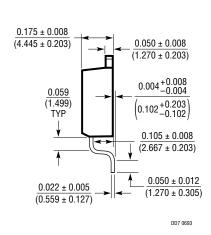

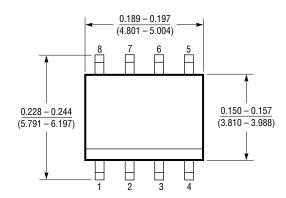

R Package 7-Lead Plastic DD

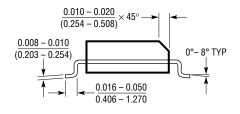

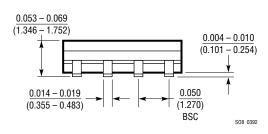

PACKAGE DESCRIPTION Dimensions in inches (millimeters) unless otherwise noted.

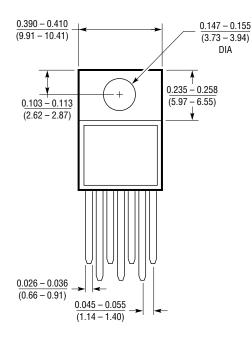

S8 Package 8-Lead Plastic SOIC

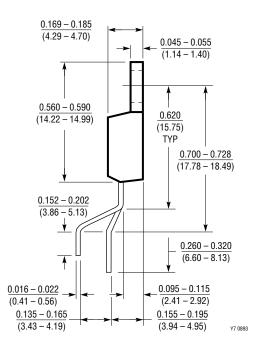

Y Package 7-Lead TO-220
