

The Infinite Bandwidth Company™

MIC4690

500kHz 1A SuperSwitcher™ Buck Regulator

Final Information

General Description

The MIC4690 SuperSwitcher™ is an easy-to-use, 500kHz step-down PWM voltage regulator. The MIC4690 achieves over 1A of continuous output current over a wide input voltage range in an 8-lead SO (small outline) package.

The high switching frequency of the MIC4690 allows the smallest surface-mount inductors and capacitors to be used. Internal compensation ensures fast transient response and a minimum amount of external components.

The MIC4690 features a power SO-8 package with a special lead frame that allows over 1A of continuous current. The MIC4690, housed in an SO-8, can replace larger TO-220 and TO-263 packages in many applications.

The MIC4690 allows for a high degree of safety. It has a wide input voltage range of 4V to 34V, allowing for it to be used in applications where input voltage transients may be present. Built-in safety features include over-current protection, frequency foldback protection, and thermal shutdown.

The MIC4690 is available in an 8-lead SO package with a junction temperature range of -40°C to $+125^{\circ}\text{C}$.

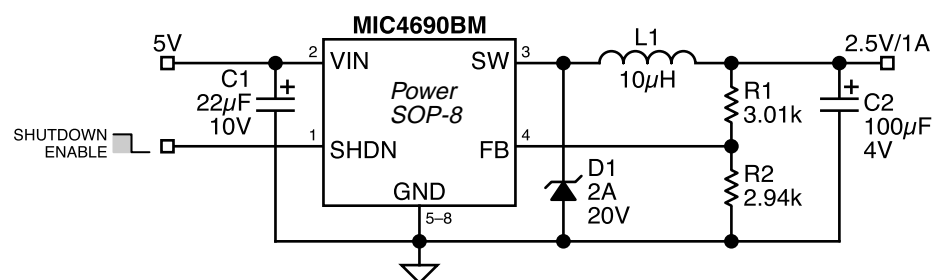

Features

- SO-8 package with over 1A output current
- Fixed 500kHz operation
- Wide 4V to 34V input voltage range
- Output voltage adjustable to 1.23V
- All surface mount solution
- Internally compensated with fast transient response
- Up to 85% efficiency
- Overcurrent protection
- Frequency foldback short-circuit protection
- Thermal shutdown

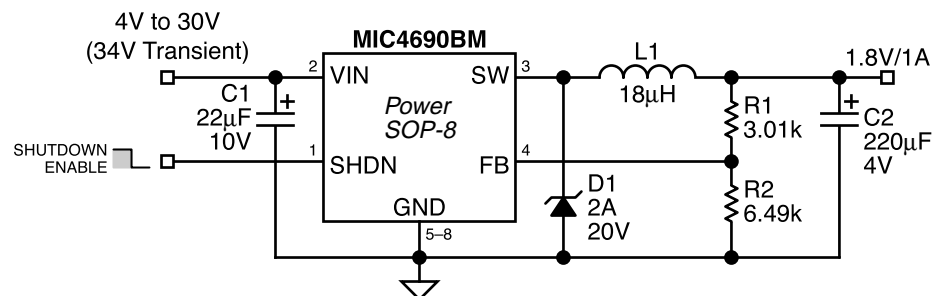

Applications

- Simple 1A step-down (buck) regulator
- Replacement of TO-220 and TO-263 designs
- 12V to 5V/3.3V/2.5V/1.8V/1.5V conversion
- 5V to 2.5V/1.8V/1.5V conversion
- On-card switching regulators
- Hard disk drives
- Cable modems
- Positive-to-negative converters
- Simple battery chargers

Typical Application

2.5V Adjustable Converter

1.8V Adjustable Converter

SuperSwitcher is a trademark of Micrel, Inc.

Ordering Information

Part Number	Voltage	Junction Temp. Range	Package
MIC4690BM	Adjustable	–40°C to +125°C	8-lead SOP

Pin Configuration

Pin Description

Pin Number	Pin Name	Pin Function
1	SHDN	Shutdown (Input): Logic low enables regulator. Logic high (>1.5V) shuts down regulator.
2	VIN	Supply Voltage (Input): Unregulated +4V to +30V continuous supply voltage, with a maximum +34V transient voltage.
3	SW	Switch (Output): Emitter of NPN output switch. Connect to external storage inductor and Schottky diode.
4	FB	Feedback (Input): Connect to output on fixed output voltage versions, or to 1.23V-tap of voltage-divider network for adjustable version.
5-8	GND	Ground

Absolute Maximum Ratings (Note 1)

	regulator on		1.25	0.8	V
Shutdown Pin Input Current	$V_{SHDN} = 5V$ (regulator off)	-10	-0.7	10	μA
	$V_{SHDN} = 0V$ (regulator on)	-10	-1.5	10	μA
Thermal Shutdown @ T_J			160		°C

Note 1. Exceeding the absolute maximum rating may damage the device.

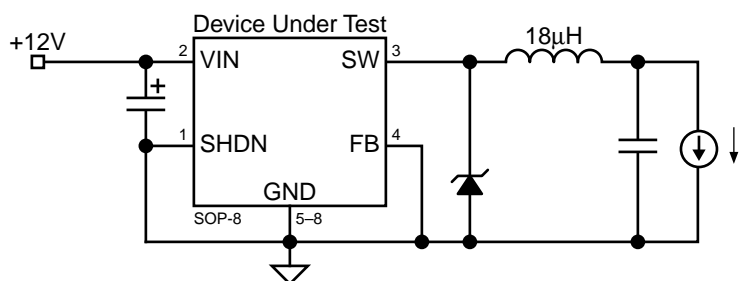

Note 2. With input voltages above the operating rating, the device may be damaged if a short-circuit is applied to the output. The device will otherwise not be damaged up to its absolute maximum voltage rating.

Note 3. Absolute maximum rating is intended for voltage transients only, prolonged dc operation is not recommended.

Note 4. Devices are ESD sensitive. Handling precautions recommended.

Note 5. Measured on 1" square of 1 oz. copper FR4 printed circuit board connected to the device ground leads.

Shutdown Input Behavior

Shutdown Hysteresis

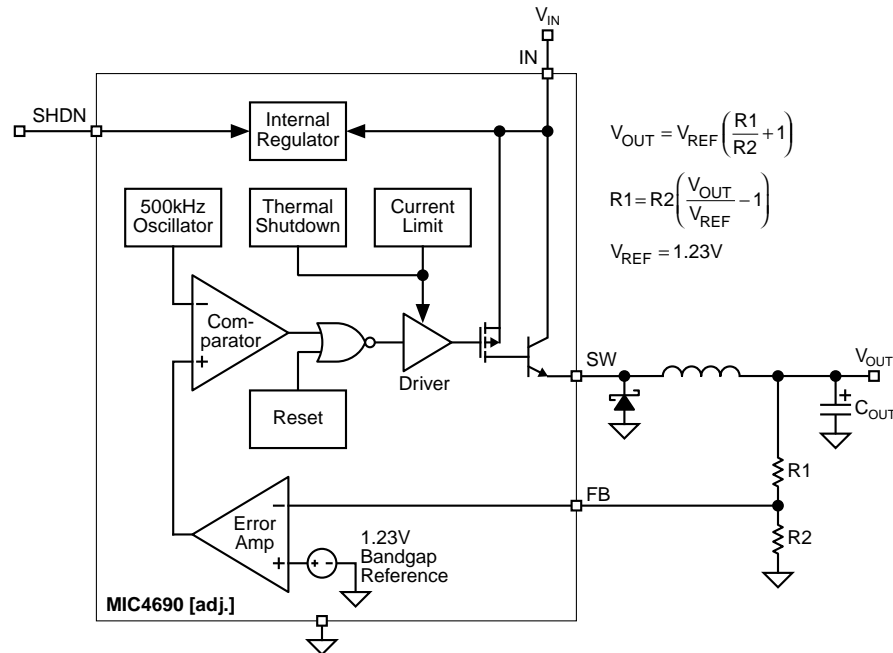

Typical Characteristics

Functional Characteristics

Block Diagrams

Adjustable Regulator

Functional Description

The MIC4690 is a variable duty cycle switch-mode regulator with an internal power switch. Refer to the block diagrams.

Supply Voltage

The MIC4690 operates from a +4V to +30V (transients to 34V) unregulated input. Highest efficiency operation is from a supply voltage around +12V. See the efficiency curve on page 5.

Enable/Shutdown

The shutdown (SHDN) input is TTL compatible. A logic-low enables the regulator. A logic-high shuts down the internal regulator which reduces the current to typically 1.5μA when $V_{SHDN} = V_{IN} = 12V$ and 30μA when $V_{SHDN} = 5V$. See "Shutdown Input Behavior: Shutdown Hysteresis."

Feedback

Fixed-voltage versions of the regulator have an internal resistive divider from the feedback (FB) pin. Connect FB directly to the output voltage.

Adjustable versions require an external resistive voltage divider from the output voltage to ground, center tapped to the FB pin. See Figure 1b for recommended resistor values.

Duty Cycle Control

A fixed-gain error amplifier compares the feedback signal with a 1.23V bandgap voltage reference. The resulting error amplifier output voltage is compared to a 500kHz sawtooth

waveform to produce a voltage controlled variable duty cycle output.

A higher feedback voltage increases the error amplifier output voltage. A higher error amplifier voltage (comparator inverting input) causes the comparator to detect only the peaks of the sawtooth, reducing the duty cycle of the comparator output. A lower feedback voltage increases the duty cycle. The MIC4690 uses a voltage-mode control architecture.

Output Switching

When the internal switch is ON, an increasing current flows from the supply V_{IN} , through external storage inductor L1, to output capacitor C_{OUT} and the load. Energy is stored in the inductor as the current increases with time.

When the internal switch is turned OFF, the collapse of the magnetic field in L1 forces current to flow through fast recovery diode D1, charging C_{OUT} .

Output Capacitor

External output capacitor C_{OUT} provides stabilization and reduces ripple.

Return Paths

During the ON portion of the cycle, the output capacitor and load currents return to the supply ground. During the OFF portion of the cycle, current is being supplied to the output capacitor and load by storage inductor L1, which means that D1 is part of the high-current return path.

Applications Information

Adjustable Regulators

Adjustable regulators require a 1.23V feedback signal. Recommended voltage-divider resistor values for common output voltages are included in Figure 1b.

For other voltages, the resistor values can be determined using the following formulas:

$$V_{OUT} = V_{REF} \left(\frac{R1}{R2} + 1 \right)$$

$$R1 = R2 \left(\frac{V_{OUT}}{V_{REF}} - 1 \right)$$

$$V_{REF} = 1.23V$$

Thermal Considerations

The MIC4690 SuperSwitcher™ features the power-SOP-8. This package has a standard 8-lead small-outline package profile, but with much higher power dissipation than a standard SOP-8. Micrel's MIC4690 SuperSwitcher™ family are the first dc-to-dc converters to take full advantage of this package.

The reason that the power SOP-8 has higher power dissipation (lower thermal resistance) is that pins 5 through 8 and the die-attach paddle are a single piece of metal. The die is attached to the paddle with thermally conductive adhesive. This provides a low thermal resistance path from the junction of the die to the ground pins. This design significantly improves package power dissipation by allowing excellent heat transfer through the ground leads to the printed circuit board.

One limitation of the maximum output current on any MIC4690 design is the junction-to-ambient thermal resistance (θ_{JA}) of the design (package and ground plane).

Examining θ_{JA} in more detail:

$$\theta_{JA} = (\theta_{JC} + \theta_{CA})$$

where:

θ_{JC} = junction-to-case thermal resistance

θ_{CA} = case-to-ambient thermal resistance

θ_{JC} is a relatively constant 20°C/W for a power SOP-8.

θ_{CA} is dependent on layout and is primarily governed by the connection of pins 5 through 8 to the ground plane. The purpose of the ground plane is to function as a heat sink.

θ_{JA} is ideally 63°C/W, but will vary depending on the size of the ground plane to which the power SOP-8 is attached.

Determining Ground-Plane Heat-Sink Area

There are two methods of determining the minimum ground plane area required by the MIC4690.

Quick Method

Make sure that MIC4690 pins 5 through 8 are connected to a ground plane with a minimum area of 6cm². This ground plane should be as close to the MIC4690 as possible. The area may be distributed in any shape around the package or on any pcb layer *as long as there is good thermal contact to pins 5 through 8*. This ground plane area is more than sufficient for most designs.

Figure 2. Power SOP-8 Cross Section

When designing with the MIC4690, it is a good practice to connect pins 5 through 8 to the largest ground plane that is practical for the specific design.

Checking the Maximum Junction Temperature:

For this example, with an output power (P_{OUT}) of 5W, (5V output at 1A maximum with $V_{IN} = 12V$) and 50°C maximum ambient temperature, what is the maximum junction temperature?

Referring to the "Typical Characteristics: 5V Output Efficiency" graph, read the efficiency (η) for 1A output current at $V_{IN} = 12V$ or perform your own measurement.

$$\eta = 75\%$$

The efficiency is used to determine how much of the output power (P_{OUT}) is dissipated in the regulator circuit (P_D).

$$P_D = \frac{P_{OUT}}{\eta} - P_{OUT}$$

$$P_D = \frac{5W}{0.75} - 5W$$

$$P_D = 1.67W$$

A worst-case rule of thumb is to assume that 80% of the total output power dissipation is in the MIC4690 ($P_{D(IC)}$) and 20% is in the diode-inductor-capacitor circuit.

$$P_{D(IC)} = 0.8 P_D$$

$$P_{D(IC)} = 0.8 \times 1.67W$$

$$P_{D(IC)} = 1.336W$$

Calculate the worst-case junction temperature:

$$T_J = P_{D(IC)} \theta_{JC} + (T_C - T_A) + T_{A(max)}$$

where:

T_J = MIC4690 junction temperature

$P_{D(IC)}$ = MIC4690 power dissipation

θ_{JC} = junction-to-case thermal resistance.

The θ_{JC} for the MIC4690's power-SOP-8 is approximately 20°C/W.

T_C = "pin" temperature measurement taken at the entry point of pins 6 or 7

T_A = ambient temperature

$T_{A(max)}$ = maximum ambient operating temperature for the specific design.

Calculating the maximum junction temperature given a maximum ambient temperature of 50°C:

$$T_J = 1.336W \times 20^\circ\text{C/W} + (63^\circ\text{C} - 25^\circ\text{C}) + 50^\circ\text{C}$$

$$T_J = 114.72^\circ\text{C}$$

This value is within the allowable maximum operating junction temperature of 125°C as listed in "Operating Ratings." Typical thermal shutdown is 160°C and is listed in "Electrical Characteristics."

Layout Considerations

Layout is very important when designing any switching regulator. Rapidly changing currents through the printed circuit board traces and stray inductance can generate voltage transients which can cause problems.

To minimize stray inductance and ground loops, keep trace lengths, indicated by the heavy lines in Figure 5, as short as possible. For example, keep D1 close to pin 3 and pins 5 through 8, keep L1 away from sensitive node FB, and keep C_{IN} close to pin 2 and pins 5 through 8. See “Applications Information: Thermal Considerations” for ground plane layout.

The feedback pin should be kept as far away from the switching elements (usually L1 and D1) as possible.

A circuit with sample layouts are provided. See Figures 6a through 6e. Gerber files are available upon request.
