

## FEATURES

- 3.3V and 5V  $\pm 10\%$  power supply options
- Guaranteed AC parameters over temperature:
  - $f_{MAX} = 800\text{MHz}$
  - $< 200\text{ps}$  differential propagation delay (D to  $Q_{FB}$ )
  - $< 730\text{ps}$  differential propagation delay (D to  $Q_{HG}$ )
  - $< 250\text{ps}$   $t_r / t_f$
- Low gain feedback path  $Q_{FB} = +10\text{V/V}$
- Output enable
- $V_{BB}$  reference output voltage
- Wide temperature range:  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$
- Available in 10-pin (3x3mm) MSOP

## PIN CONFIGURATION

## BLOCK DIAGRAM

## DESCRIPTION

The SY100EL16VO is a differential receiver amplifier optimized for crystal oscillator applications. The device includes an additional low gain ( $+10\text{V/V}$ ) output stage ( $Q_{FB}$ ) ideal for feedback applications common in crystal oscillator gain blocks. The SY100EL16VO is fully differential, with a bandwidth  $> 800\text{MHz}$  over temperature and voltage. For applications that require output disable control, an Enable pin ( $/\text{EN}$ ) will force the differential output into a fixed logic state. The SY100EL16VO also includes a  $V_{BB}$  reference voltage for single-ended or AC-coupled applications.

The SY100EL16VO PECL logic is 100k ECL compatible. Operation is guaranteed over the  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$  temperature range and 3.3V to 5V nominal supply voltage range.

## TRUTH TABLE

| $/\text{EN}$ | $Q_{HG}$ Out | $/Q_{HG}$ Out  |
|--------------|--------------|----------------|
| 0            | Data         | $/\text{Data}$ |
| 1            | Logic Low    | Logic High     |

## PIN NAMES

| Pin               | Function                                                                                                                                                                                                                                                                                                      |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $Q_{FB}, /Q_{FB}$ | Differential clock outputs for feedback path: Nominal DC gain $+10$ .                                                                                                                                                                                                                                         |
| D, $/D$           | PECL, LVPECL, ECL, LVECL differential inputs: Internal $75\text{k}\Omega$ pull-down resistor.                                                                                                                                                                                                                 |
| $V_{BB}$          | $V_{CC} - 1.32\text{V}$ reference voltage for single-ended inputs: It provides the switching reference for the input differential amplifier. When unused, it can be left open. For single-ended PECL applications connect $V_{BB}$ to $/D$ input, and bypass with a $0.01\mu\text{F}$ capacitor to $V_{CC}$ . |
| $/\text{EN}$      | Enable: PECL compatible input control with internal $75\text{k}\Omega$ pull-down resistor. It controls the high-gain output ( $Q_{HG}$ ). When HIGH, $Q_{HG}$ is low and $/Q_{HG}$ is high. $/\text{EN}$ is synchronous so that the outputs will only be enabled/disabled when they are in the LOW state.     |
| $V_{EE}$          | Negative power supply: For ECL/LVECL operation, connect to negative supply. For PECL/ LVPECL operation, connect to GND.                                                                                                                                                                                       |
| $Q_{HG}, /Q_{HG}$ | Differential high-gain outputs: Nominal DC gain is greater than $+200$ .                                                                                                                                                                                                                                      |
| $V_{CC}$          | Positive power supply: For ECL/LVECL operation, connect to $V_{CC} = 0\text{V}$ . For PECL/ LVPECL operation, connect to either 3.3V or 5.0V. Bypass with $0.1\mu\text{F}$ / $0.01\mu\text{F}$ low ESR capacitors.                                                                                            |

**ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>**

| Symbol            | Rating                                                                        | Value               | Unit |
|-------------------|-------------------------------------------------------------------------------|---------------------|------|
| $V_{CC} - V_{EE}$ | Power Supply Voltage                                                          | +6.0                | V    |
| $V_{IN}$          | PECL Input Voltage                                                            | 0 to $V_{CC} + 0.5$ | V    |
| $V_{OUT}$         | Voltage Applied to Output at High State ( $V_{EE} = 0V$ )                     | -0.5 to +5.5        | V    |

| $\theta_{JC}$     | Package Thermal Resistance<br>(Junction-to-Case)                              | 42                  | °C/W |

**NOTE:**

1. Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to ABSOLUTE MAXIMUM RATING conditions for extended periods may affect device reliability.

**NOTES:**

1. Input and output parameters are at  $V_{CC} = +3.3V$ . Level specifications will vary 1:1 with  $V_{CC}$ .
2.  $V_{IHCMR}$  is referenced to the most positive side of the differential input signal.

### NOTES:

1. See "Timing Waveform."
2. Duty cycle skew is the difference between  $t_{PLH}$  and  $t_{PHL}$  propagation delay through the device.
3. The device has a DC gain of 10 for  $Q$ ,  $/Q$  outputs, and DC gain of 200 or higher for  $Q_{HG}$ ,  $/Q_{HG}$ . See "Timing Waveform" minimum input swing.

## TIMING WAVEFORMS

Figure 1. Minimum Input Swing

Figure 2. Set-Up and Hold Timing

TERMINATION RECOMMENDATIONS

Figure 3. Parallel Termination-Thevenin Equivalent

NOTES:

- 1. For +5V systems:  
R1 = 82Ω  
R2 = 130Ω

Figure 4. Three-Resistor “Y-Termination”

NOTES:

- 1. Power-saving alternative to 4-resistor, Thevenin termination.
- 2. Place termination resistors as close to destination inputs as possible.
- 3. R<sub>b</sub> resistor sets the DC bias voltage, equal to V<sub>t</sub>. For +5V, R<sub>b</sub> = 100Ω
