

## FEATURES

- Single 3.3V or 5V power supply
- Up to 155Mbps operation
- Low noise PECL data outputs
- Chatter-free TTL Signal Detect (SD) output
- TTL EN input
- Programmable SD level set ( $SD_{LVL}$ )
- Available in tiny 10-pin MSOP (3mm × 3mm) package

## APPLICATIONS

- 155Mbps SONET/SDH
- Small form factor transceivers
- High-gain line driver and line receiver

## DESCRIPTION

The SY88893V low-power limiting post amplifier is designed for use in fiber-optic receivers. The device connects to typical transimpedance amplifiers (TIAs). The linear signal output from TIAs can contain significant amounts of noise and may vary in amplitude over time. The SY88893V quantizes these signals and outputs PECL level waveforms.

The SY88893V operates from a single +3.3V or +5V power supply, over temperatures ranging from  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ . With its wide bandwidth and high gain, signals with data rates up to 155Mbps and as small as 5mVp-p can be amplified to drive devices with PECL inputs.

The SY88893V generates a TTL SD output. A programmable signal-detect level set pin ( $SD_{LVL}$ ) sets the sensitivity of the input amplitude detection. SD asserts high if the input amplitude rises above the threshold set by  $SD_{LVL}$  and deasserts low otherwise. EN deasserts the true output signal without removing the input signal. Typically 6dB SD hysteresis is provided to prevent chattering.

**TYPICAL OPERATING CHARACTERISTICS**

## DETAILED DESCRIPTION

The SY88893V low-power limiting post amplifier operates from a single +3.3V or +5V power supply, over temperatures from  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ . Signals with data rates up to 155Mbps and as small as 5mVp-p can be amplified. Figure 1 shows the allowed input voltage swing. The SY88893V generates an SD output.  $\text{SD}_{\text{LVL}}$  sets the sensitivity of the input amplitude detection.

### Input Amplifier/Buffer

Figure 2 shows a simplified schematic of the SY88893V's input stage. The high-sensitivity of the input amplifier allows signals as small as 5mVp-p to be detected and amplified. The input amplifier allows input signals as large as 1800mVp-p. Input signals are linearly amplified with a typically 38dB differential voltage gain. Since it is a limiting amplifier, the SY88893V outputs typically 1500mVp-p voltage-limited waveforms for input signals that are greater than 18mVp-p. Applications requiring the SY88893V to operate with high-gain should have the upstream TIA placed as close as possible to the SY88893V's input pins to ensure the best performance of the device.

### Output Buffer

The SY88893V's PECL output buffer is designed to drive 50 $\Omega$  lines. The output buffer requires appropriate termination for proper operation. An external 50 $\Omega$  resistor to  $V_{\text{CC}}-2\text{V}$  for each output pin provides this. Figure 3 shows a simplified schematic of the output stage and includes an appropriate termination method.

### Signal-Detect

The SY88893V generates a chatter-free SD open-collector TTL output with internal 6.75k $\Omega$  pullup resistor as shown in Figure 4. SD is used to determine that the input amplitude is large enough to be considered a valid input. SD asserts high if the input amplitude rises above the threshold set by  $\text{SD}_{\text{LVL}}$  and deasserts low otherwise. SD can be fed back to the enable (EN) input to maintain output stability under a loss of signal condition. EN deasserts the true output signal without removing the input signals. Typically 6dB SD hysteresis is provided to prevent chattering.

### Signal-Detect Level Set

A programmable signal-detect level set pin ( $\text{SD}_{\text{LVL}}$ ) sets the threshold of the input amplitude detection. Connecting an external resistor between  $V_{\text{CC}}$  and  $\text{SD}_{\text{LVL}}$  sets the voltage at  $\text{SD}_{\text{LVL}}$ . This voltage ranges from  $V_{\text{CC}}$  to  $V_{\text{REF}}$ . The external resistor creates a voltage divider between  $V_{\text{CC}}$  and  $V_{\text{REF}}$  as shown in Figure 5. If desired, an appropriate external voltage may be applied rather than using a resistor. The smaller the external resistor, implying a smaller voltage difference from  $\text{SD}_{\text{LVL}}$  to  $V_{\text{CC}}$ , the smaller the SD sensitivity. Hence, larger input amplitude is required to assert SD. "Typical Operating Characteristics" shows the relationship between the input amplitude detection sensitivity and the  $\text{SD}_{\text{LVL}}$  voltage.

### Hysteresis

The SY88893V provides typically 6dB SD electrical hysteresis. By definition, a power ratio measured in dB is  $10\log(\text{power ratio})$ . Power is calculated as  $V_{\text{IN}}^2/R$  for an electrical signal. Hence, the same ratio can be stated as  $20\log(\text{voltage ratio})$ . While in linear mode, the electrical voltage input changes linearly with the optical power and hence the ratios change linearly. Therefore, the optical hysteresis in dB is half the electrical hysteresis in dB given in the datasheet. The SY88893V provides typically 3dB SD optical hysteresis. As the SY88893V is an electrical device, this datasheet refers to hysteresis in electrical terms. With 6dB SD hysteresis, a voltage factor of two is required to assert or deassert SD.

## FUNCTIONAL BLOCK DIAGRAM

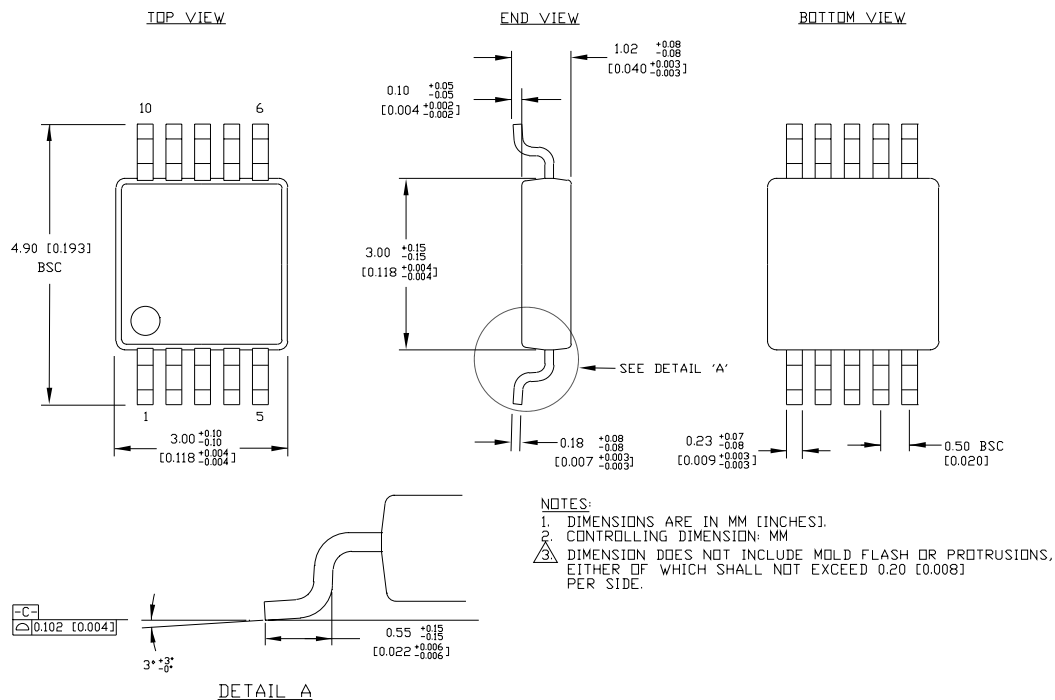

## DESIGN PROCEDURE

### Layout and PCB Design

Since the SY88893V is a high-frequency component, performance can be largely determined by the board layout and design. A common problem with high-gain amplifiers is the feedback from the large swing outputs to the input via the power supply.

The SY88893V's ground pin should be connected to the circuit board ground. Use multiple PCB vias close to the part to connect to ground. Avoid long, inductive runs which can degrade performance.
