

FEATURES

- 3.3V and 5V power supply option
- Up to 1.25Gbps operation
- Low noise
- Chatter-Free LOS Generation
- Open Collector TTL LOS Output
- TTL /EN Input
- Differential PECL inputs for data
- Single power supply
- Designed for use with (Micrel-Synergy laser diode driver and controller)
- Available in a tiny 10-pin (3mm) MSOP

DESCRIPTION

The SY88903V limiting post amplifier with its high gain and wide bandwidth is ideal for use as a post amplifier in fiber-optic receivers with data rates up to 1.25Gbps. Signals as small as 5mVp-p can be amplified to drive devices with PECL inputs. The SY88903V generates a chatter-free Loss of Signal (LOS) open collector TTL output.

The SY88903V incorporates a programmable level detect function to identify when the input signal has been lost. This information can be fed back to the /EN input of the device to maintain stability under loss of signal condition. The sensitivity of the level detection can be adjusted using LOSLVL. The LOSLVL voltage can be set by connecting a resistor divider between VCC and VREF as shown in Figure 3. Figure 4 and 5 show the relationship between input level sensitivity and the voltage set on LOSLVL.

The LOS output is a TTL open collector output that requires a pull-up resistor for proper operation, Figure 1.

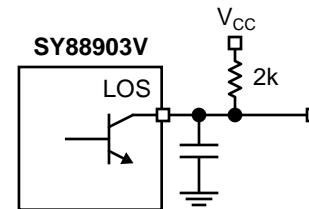

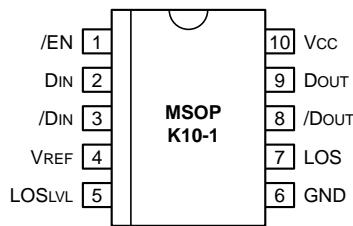

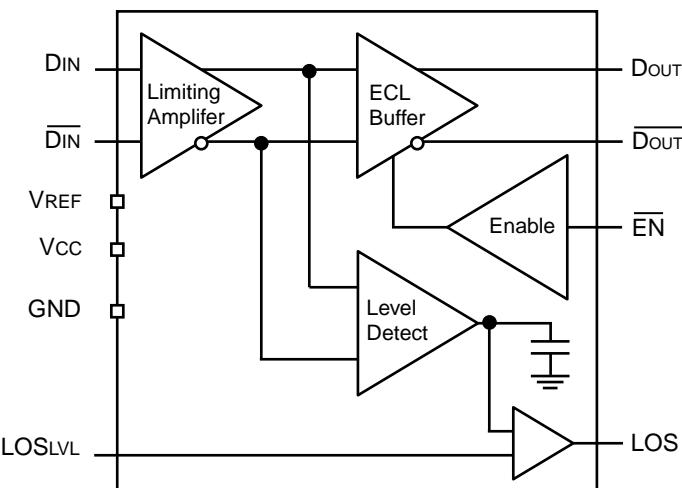

Figure 1. LOS Output with Desired Rise Time

APPLICATIONS

- 1.25Gbps Gigabit Ethernet
- 531Mbps and 1062Mbps Fibre Channel
- 622Mbps SONET
- Gigabit Interface Converter

BLOCK DIAGRAM

PIN NAMES**GENERAL DESCRIPTION**

Pin	Type	Function
DIN	Data Input	Data Input
/DIN	Data Input	Inverting Data Input
LOS LVL	Input	LOS Limit Set
/EN	TTL Input	Output Enable (Active Low)
LOS	TTL Output (Open Collector)	Loss of Signal Indicator (Active High)
GND	Ground	Ground
/DOUT	PECL Output	Inverting Data Output
DOUT	PECL Output	Data Output
Vcc	Power Supply	Positive Power Supply
VREF	Output	Reference Voltage Output for LOS Level Set (see Fig. 3)

General

The SY88903V is an integrated limiting amplifier intended for high-frequency fiber-optic applications. The circuit connects to typical transimpedance amplifiers found within a fiber-optics link. The linear signal output from a transimpedance amplifier can contain significant amounts of noise, and may vary in amplitude over time. The SY88903V limiting amplifier quantizes the signal and outputs a voltage-limited waveform.

The /EN pin allows the user to disable the output signal without removing the input signal.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Symbol	Rating	Value	Unit
Vcc	Power Supply Voltage	0 to +7.0	V
DIN, /DIN	Input Voltage	0 to Vcc	V
DOUT, /DOUT	Output Voltage (with 50Ω load)	Vcc -2.5 to Vcc +0.3	V
/EN	Input Voltage	0 to Vcc	V
LOSLVL	Input Voltage	0 to Vcc	V
VREF	Output Voltage	Vcc -2.0 to Vcc	V
TA	Operating Temperature Range	-40 to +85	°C
T _{store}	Storage Temperature Range	-55 to +125	°C

NOTE:

1. Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to ABSOLUTE MAXIMUM RATING conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

V_{CC} = +5V ±10% or +3.3V ±10%; R_{LOAD} = 50Ω to V_{CC} -2V, TA = −40°C to +85°C

Symbol	Parameter	TA = −40°C		TA = 0°C		TA = +25°C			TA = +85°C		Unit

HYS	LOS Hysteresis	2	8	2	8	2	4.6	8	2	8	dB	2 ²³ -1 pattern

NOTES:

1. Input referred noise = RMS output noise/low frequency gain.
2. Input is a 622MHz square wave.

3. Input is a 200MHz square wave, tr < 300ps, 8mVp-p.

4. Input is a 200MHz square wave, tr < 300ps, 1.8Vp-p.

DESIGN PROCEDURE

Output Termination

The SY88903V outputs must be terminated with a 50Ω load to VCC – 2V (or Thevenin equivalent).

Layout and PCB Design

Since the SY88903V is a high-frequency component, performance can largely be determined by board layout and design. A common problem with high-gain amplifiers is feedback from the large swing outputs to the input via the power supply.

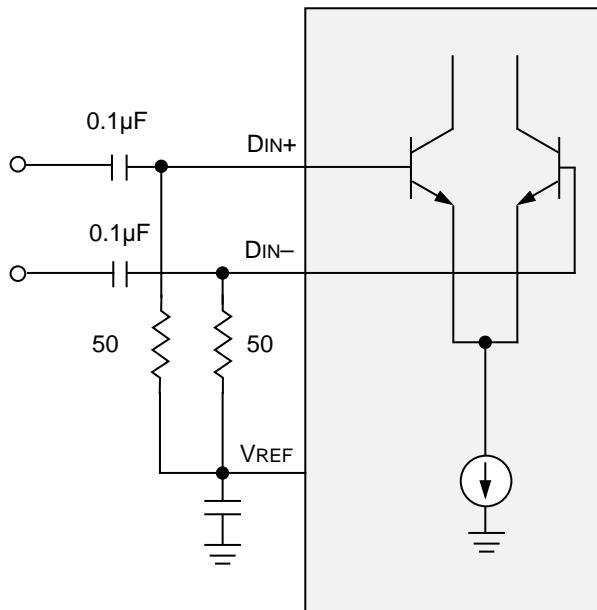

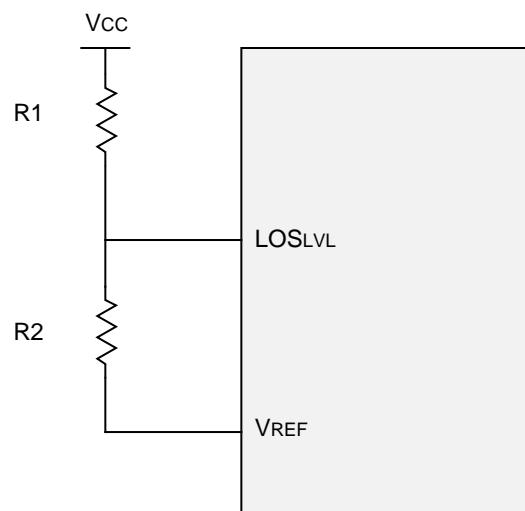

Figure 2. Differential Input Configuration

The SY88903V ground pin should be connected to the circuit board ground. Use multiple PCB vias close to the part to connect to ground. Avoid long, inductive runs which can degrade performance.

NOTES:
 $\text{LOSLVL} = \text{VCC} - 1.32V \times \frac{R2 \times 1.32V}{R1 + R2}$
 $R1 + R2 \geq 2.6k\Omega$

Figure 3. LOSLVL Circuit
