

## FEATURES

- 3.3V and 5V power supply options
- Up to 1.5Gbps operation
- Low power
- Low noise
- Chatter-Free /LOS Generation
- PECL /LOS Output
- TTL /EN Input
- Differential PECL inputs for data
- /EN input is TTL with internal 27K pull up
- Single power supply
- Designed for use with Micrel-Synergy laser diode driver and controller
- Available in a tiny 10-pin (3mm) MSOP

## DESCRIPTION

The SY88913V limiting post amplifier with its high gain and wide bandwidth is ideal for use as a post amplifier in fiber-optic receivers with data rates up to 1.5Gbps. Signals as small as 5mVp-p can be amplified to drive devices with PECL inputs. The SY88913V generates a chatter-free PECL Loss of Signal (/LOS) output.

The SY88913V incorporates a programmable level detect function to identify when the input signal has been lost. This information can be fed back to the /EN input of the device to maintain stability under loss of signal conditions. Using  $LOS_{LVL}$  pin the sensitivity of the level detect can be adjusted. The  $LOS_{LVL}$  voltage can be set by connecting a resistor divider between  $V_{CC}$  and  $V_{REF}$ . Figure 2. Figure 3 and 4 show the relationship between input level sensitivity and the voltage set on  $LOS_{LVL}$ .

## PIN CONFIGURATION

## APPLICATIONS

- 1.25Gbps Gigabit Ethernet
- 531Mbps and 1062Mbps Fibre Channel
- 622Mbps SONET
- Gigabit Interface Converter

## BLOCK DIAGRAM

**PIN NAMES**

| Pin                | Type         | Function                                                |
|--------------------|--------------|---------------------------------------------------------|
| D <sub>IN</sub>    | Data Input   | Data Input                                              |
| /D <sub>IN</sub>   | Data Input   | Inverting Data Input                                    |

**GENERAL DESCRIPTION****General**

The SY88913V is an integrated limiting amplifier intended for high-frequency fiber-optic applications. The circuit connects to typical transimpedance amplifiers found within a fiber-optics link. The linear signal output from a transimpedance amplifier can contain significant amounts of noise, and may vary in amplitude over time. The SY88913V limiting amplifier quantizes the signal and outputs a voltage-limited waveform.

The TTL /EN pin allows the user to disable the signal without removing the input signal.

**ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>**

| Symbol                                      | Rating                         | Value                                        | Unit |
|---------------------------------------------|--------------------------------|----------------------------------------------|------|
| V <sub>CC</sub>                             | Power Supply Voltage           | 0 to +7.0                                    | V    |
| D <sub>IN</sub> , /D <sub>IN</sub>          | Input Voltage                  | 0 to V <sub>CC</sub>                         | V    |
| D <sub>OUT</sub> , /D <sub>OUT</sub> , /LOS | Output Voltage (with 50Ω load) | V <sub>CC</sub> -2.5 to V <sub>CC</sub> +0.3 | V    |
| LOS <sub>LVL</sub>                          | Input Voltage                  | 0 to V <sub>CC</sub>                         | V    |

| T <sub>A</sub>                              | Operating Temperature Range    | -40 to +85                                   | °C   |
| T <sub>store</sub>                          | Storage Temperature Range      | -55 to +125                                  | °C   |

**NOTE:**

1. Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to ABSOLUTE MAXIMUM RATING conditions for extended periods may affect device reliability.

**NOTES:**

1. Input referred noise = RMS output noise/low frequency gain.
2. Input is 622MHz square wave.

3. Input is a 200MHz square wave,  $t_r < 300ps$ , 8mVp-p.
4. Input is a 200MHz square wave,  $t_r < 300ps$ , 1.8Vp-p.

## APPLICATION NOTE

### Output Termination

The SY88913V outputs must be terminated with a 50Ω load to  $V_{CC} - 2V$  (or Thevenin equivalent).

### Layout and PCB Design

Since the SY88913V is a high-frequency component, performance can largely be determined by board layout and design. A common problem with high-gain amplifiers is feedback from the large swing outputs to the input via the power supply.

Figure 1. Differential Input Configuration

The SY88913V ground pin should be connected to the circuit board ground. Use multiple PCB vias close to the part to connect to ground. Avoid long, inductive runs which can degrade performance.

Figure 2. LOS<sub>LVL</sub> Circuit

#### NOTES:

$$LOS_{LVL} = V_{CC} - 1.32 + \frac{R2 \times 1.32}{R1 + R2}$$

$$R1 + R2 \geq 5k\Omega$$

## PRODUCT ORDERING CODE

| Ordering Code | Package Type | Operating Range |
|---------------|--------------|-----------------|
| SY88913VKC    | K10-1        | Commercial      |
