

BIPOLAR ANALOG INTEGRATED CIRCUIT

μ PC1470H

MOTOR SPEED REGULATORS

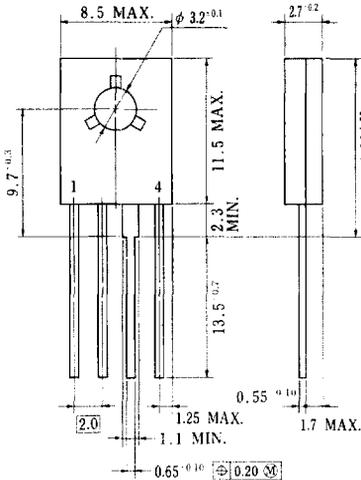

DESCRIPTION

The μ PC1470H is a monolithic integrated circuit intended as speed regulators for DC motors of record players, tape and cassette recorders etc. The device is packaged in a new developed 4-lead quasi-TD-126 plastic case.

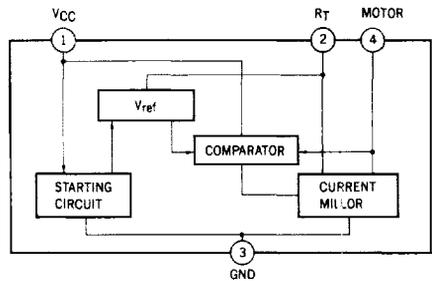

FEATURES

- Excellent versatility in use.
- High Output current.
- Low Quiescent current.
- Low Reference voltage.
- Excellent parameters stability versus temperature.
- Excellent characteristic at low supply voltage.

APPLICATION INFORMATION

[BASIC EQUATION FOR THE MOTOR]

$$\begin{cases} E_t = V_{ref} + R_T (i_2 + \frac{V_{ref}}{R_S}) \\ i_2 = \frac{1}{K} i_4 + i_q \\ i_a = i_m + \frac{V_{ref}}{R_S} \end{cases}$$

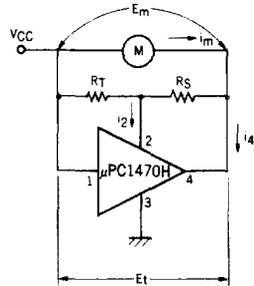

$$E_t = V_{ref} + R_T \left(\frac{1}{K} i_4 + i_q + \frac{V_{ref}}{R_S} \right)$$

$$E_t = V_{ref} + R_T \left\{ \frac{1}{K} (i_m + \frac{V_{ref}}{R_S}) + i_q + \frac{V_{ref}}{R_S} \right\}$$

$$E_t = V_{ref} \left\{ 1 + \frac{R_T}{R_S} \left(1 + \frac{1}{K} \right) \right\} + R_T i_q + \frac{R_T}{K} i_m$$

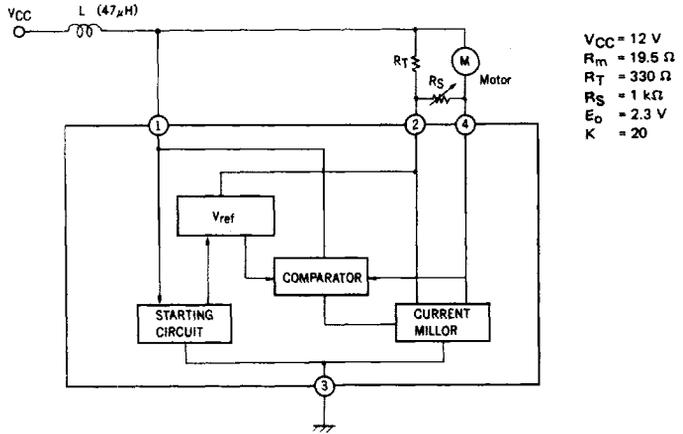

They also give: $E_m = E_o + R_m i_m$

$$\begin{cases} E_o = V_{ref} \left\{ 1 + \frac{R_T}{R_S} \left(1 + \frac{1}{K} \right) \right\} + R_T i_q \\ R_m = \frac{R_T}{K} \end{cases}$$

(E_o : Back Electromotive Force
 R_m : Internal Resistance (of the Motor)
 K : Reflection Coefficient (= i_4/i_2)

APPLICATION CIRCUIT

Note 1. The motor speed can be adjusted by the variable resistor R_S .

$$R_{S\text{min.}} = \frac{V_{\text{ref}} \cdot R_T}{E_o - V_{\text{ref}} - I_q \cdot R_T}$$

Note 2. If $R_{T\text{max.}} > K \cdot R_{m\text{min.}}$, instability of the motor may occur.
