

FEATURES

- 3.3V, 5.0V, 12V, 15V and Adjustable Output Versions
- Adjustable Version Output Voltage Range, 1.23V to 37V +/- 4% maximum over line and load conditions
- Guaranteed 3A Output Current
- Wide Input Voltage Range
- Requires Only 4 External Components
- 300KHz Fixed Frequency Internal Oscillator
- TTL Shutdown Capability, Low Power Standby Mode
- Uses Readily Available Standard Inductors
- Thermal Shutdown and Current Limit Protection
- Moisture Sensitivity Level 3 for SMD packages

APPLICATION

- Simple High-Efficiency Step-Down(Buck) Regulator
- On-Card Switching Regulators
- Positive to Negative Converter

DESCRIPTION

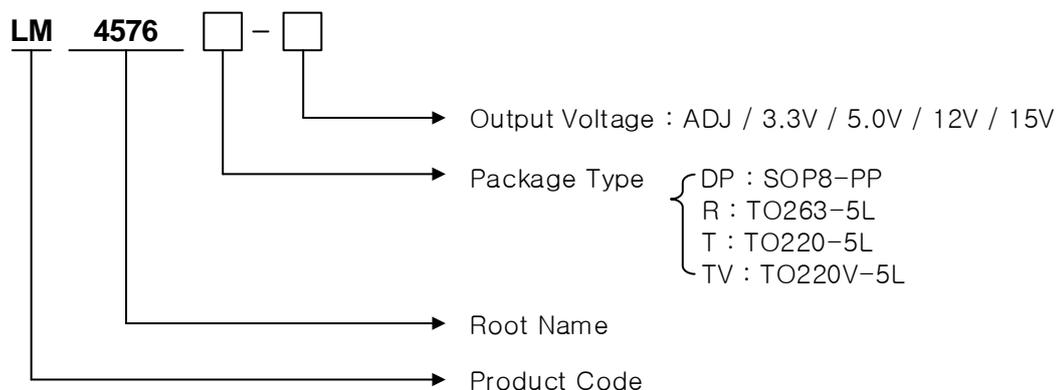

The LM4576 series of regulators are monolithic integrated circuits that provide all the active functional for a step-down (buck) switching regulator, capable of driving 3A load with excellent line and load regulation. These devices are available in fixed output voltages of 3.3V, 5.0V, 12V, 15V and an adjustable output versions. Requiring a minimum number of external components, these regulators are simple to use and include internal frequency compensation, and a fixed-frequency oscillator.

The LM4576 series operates at a switching frequency of 300KHz thus allowing smaller sized filter components than what would be needed with lower frequency switching regulators.

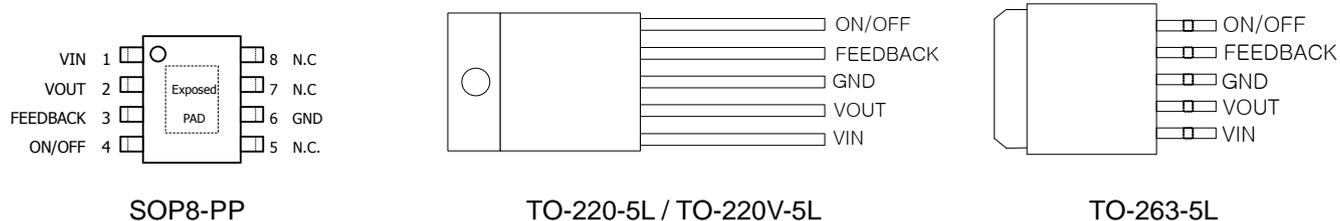

Some features include a guaranteed +/- 4% tolerance on output voltage under specified input voltage and output load conditions, and +/- 15% on the oscillator frequency. External shutdown is included, featuring typically 60uA standby current. The output switch includes cycle-by-cycle current limiting, as well as thermal shutdown for full protection under fault conditions. The oscillator frequency is reduced in the event of an output short or an overload which causes the regulated output voltage to drop approximately 40% from the nominal output voltage.

PIN CONFIGURATION

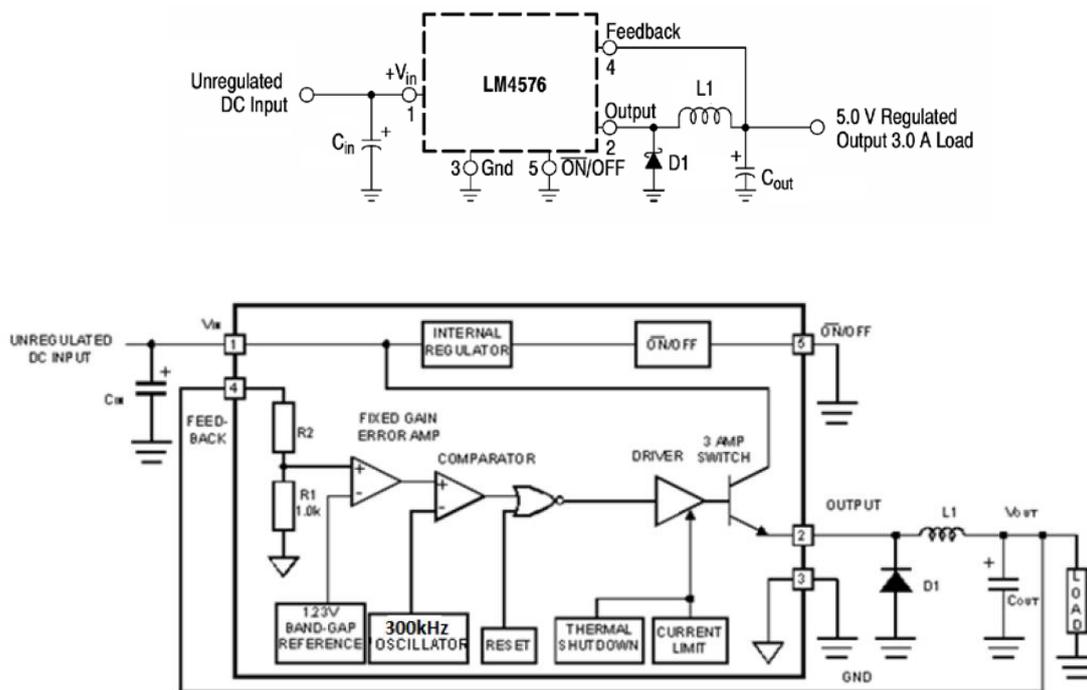

PIN DESCRIPTION

Package		Symbol	Description
TO-263-5L TO-220-5L TO-220V-5L	SOP8-PP		
1	1	VIN	This pin is the positive input supply for the LM4576 step-down switching regulator. In order to minimize voltage transients and to supply the switching currents needed by the regulator, a suitable input bypass capacitor must be present. (C _{in} in Figure 1).
2	2	VOUT	This is the emitter of the internal switch. The saturation voltage V _{SAT} of this output switch is typically 1.4V. It should be kept in mind that the PCB area connected to this pin should be kept to a minimum in order to minimize coupling to sensitive circuitry.
3	6	GND	Circuit ground pin. See the information about the printed circuit board layout.
4	3	FEEDBACK	This pin senses regulated output voltage to complete the feedback loop. The signal is divided by the internal resistor divider network R1, R2 and applied to the non-inverting input of the internal error amplifier. In the adjustable version of the LM4576 switching regulator this pin is the direct input of the error amplifier and the resistor network R1, R2 is connected externally to allow programming of the output voltage.
5	4	ON/OFF	It allows the switching regulator circuit to be shutdown using logic level signals, thus dropping the total input supply current to approximately 60uA. The threshold voltage is typically 1.4V. Applying a voltage above this value (up to +V _{in}) shuts the regulator off. If the voltage applied to this pin is lower than 1.4V or if this pin is left open, the regulator will be in the "on" condition
-	5, 7, 8	N.C.	No Connect.

* Exposed Pad of SOP8-PP package should be externally connected to GND.

TYPICAL APPLICATION (Fixed Output Voltage Versions)

3.3V, R2 = 1.7K
 5V, R2 = 3.1K
 12V, R2 = 8.84K
 15V, R2 = 11.3K
 For ADJ Version R1 = Open, R2 = 0Ω

- The oscillator frequency reduces to approximately 75 KHz in the event of an output short or an overload which causes the regulated output voltage to drop approximately 40% from the nominal voltage. This self protection feature lowers the average dissipation of the IC by lowering the minimum duty cycle from 5% down to approximately 2%
- Output pin sourcing current. No diode, inductor or capacitor connected to output.
- Feedback pin removed from output and connected to 0V.
- Feedback pin removed from output and connected to +12V for the Adjustable, 3.3V, and 5.0V versions, and +25V for the 12V and 15V version, to force the output transistor "off".
- $V_{in} = 40V$.
