UHF Planar Triodes
CW, Plate or Grid Pulsed
Phormat Cathode
Extended Grid-Anode Insulator
3 GHz

DESCRIPTION

The ML-7815/3CPN10A5 and ML-7815R are ruggedized, high-mu planar triodes of ceramic-and-metal construction, designed for use as grid-pulsed, plate-pulsed or CW oscillators, frequency multipliers, or amplifiers in radio transmitting service from low frequency to 3 GHz. The ML-7815/3CPN10A5 is supplied without a radiator for conduction-convection cooling. The ML-7815R is supplied with a radiator for forced-air cooling. Except for plate-dissipation ratings, the characteristics of the two tubes are the same.

A special feature of these tubes as compared to other tubes fitting the same socket is an extended grid-anode insulator

in the tube envelope. The extended grid-anode insulator is an important feature in airborne equipment operating at high altitudes. Other features of these tubes include low inter-electrode capacitance, high transconductance, and great mechanical strength. The tubes also employ a Phormat type cathode which consists of an indirectly heated disc with an oxide coating impregnated in a nickel matrix. This construction, in combination with proper plate series impedance, reduces to a minimum failures of the cathode due to voltage surges.
