
ML-8403
DESCRIPTION AND RATINGS
DESCRIPTION

The ML-8403 is a ruggedized, high-mu planar triode of ceramic-and-metal construction, designed for use as a grid-pulsed, plate-pulsed, or CW oscillator, frequency multiplier, or amplifier in radio transmitting service from low frequency to 3 Gc.

A distinguishing characteristic of this tube is its high cathode-current capability. In addition to low interelectrode

capacitance, high transconductance and high mu, this tube also incorporates design features which help to assure frequency-stable operation even under conditions of adverse ambient temperature and varying plate dissipation. The anode is forced-air cooled. The cathode is an indirectly-heated oxide-coated disc.
