

ML-893A

DESCRIPTION AND RATINGS

DESCRIPTION

The ML-893A is a three-electrode tube designed specifically for use as a modulator, amplifier, or oscillator in radio transmitting service. The cathode is a pure-tungsten filament and can be operated from single, three, or six-phase power supply; it has been designed for maximum strength to minimize the possibility of grid to filament shorts. The anode is water-cooled and is capable of dissipating 20 kilowatts. Maximum ratings

of 20 kVdc plate voltage and 70 kW plate input apply at frequencies up to 5 mc/sec; operation at 40 mc/sec is permissible with voltage and input reduced to one-half maximum ratings.

The ML-893A embodies the highest standards for this tube type. All types are thoroughly processed by special Machlett techniques to assure efficient operation and long life.

GENERAL CHARACTERISTICS

Electrical

The ML-893A can be operated at full power at frequencies as high as 5 megacycles. It can be operated at higher frequencies provided the maximum values of plate voltage and plate input are reduced in accordance with table which shows the maximum permissible percentage of rated plate voltage and plate input for various frequencies above 5 megacycles.
