#### Forced-Air Cooling:

Through Base Toward Bulb . . . . . 2 cfm

The specified air flow from a small fan or centrifugal blower should be applied simultaneously with filament power.

#### Of Bulb and Plate Seal:

**Continuous Service:** At frequencies below 30 Mc, relatively slow movement of air past the tube is sufficient to prevent exceeding the specified plate-seal temperature. At frequencies above 30 Mc, special attention should be given to adequate cooling of bulb and plate seal. A small fan directed toward the upper part of the bulb will generally provide sufficient cooling.

**Intermittent Service:** ("On" period does not exceed 5 minutes and is followed by "off" period of the same or greater duration): At frequencies below

<sup>b</sup> Metal base shell should be grounded by means of suitable spring fingers.

## VHF POWER TETRODE

30 Mc, forced-air cooling of the bulb and plate seal is not usually required if the ambient temperature is below 30°C, provided a heat-radiating plate connector is used and free circulation of air is provided.

Plate-Seal Temperature (Measured on top of plate cap):

Continuous Service . . . . .	170 max.	°C
Intermittent Service (As defined above). . . . .	220 max.	°C
