MAXIMUM CIRCUIT VALUES

Grid-No. 1-Circuit Resistance:	R _{g(ckt)}		
Cathode bias	R _K	1.0	megohm
(with min. R _K = 100 Ω)			
Grid-leak bias		10.0	megohms
(with signal peak clamped to zero bias)			
Fixed bias		0.47	megohm
(where positive grid current is not drawn)			

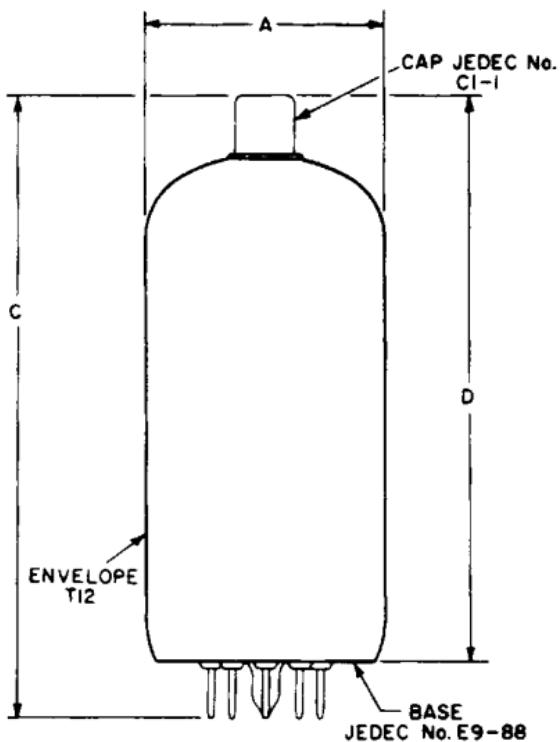

- a Measured without external shield in accordance with the current issue of EIA Standard RS-191B.
- b With grid No. 3 and grid No. 2 connected, respectively, to cathode and plate at socket.
- c Conditions: E_b = E_{c2} = 125V, E_{c1} = -25V.
- d This value can be measured by a method involving a recurrent waveform such that the Maximum Ratings of the tube will not be exceeded.
- e Under pulse-duration condition specified in *Footnote g*.
- f As defined in the current issue of EIA Standard RS-239A.

- g This rating is applicable when the duration of the voltage pulse does not exceed 15% of one horizontal scanning cycle. In a 525-line, 30-frame system, 15% of one scanning cycle is 10 μ s.
- h In horizontal-deflection-amplifier service, a positive voltage should be applied to grid No. 3 to reduce interference from "snivets", which may occur in both vhf and uhf television receivers, and to increase power output. A typical value is 30V.
- j An adequate bias resistor or other means is required to protect the tube in the absence of excitation.
- k Total continuous or accumulated time not to exceed 40 seconds.
