BEAM POWER TUBE

9-PIN MINIATURE TYPE

For use in communications equipment operating from 6-cell storage-battery systems

GENERAL DATA**Electrical:**

Heater, for Unipotential Cathode:

Voltage range	12 to 15	volts
Current at 13.5 volts.	0.36	amp
Direct Interelectrode Capacitances: ⁰		
Grid No.1 to plate	0.15 max.	μuf
Grid No.1 to cathode, grid No.3, grid No.2, and heater	10	μuf
Plate to cathode, grid No.3, grid No.2, and heater	5.5	μuf

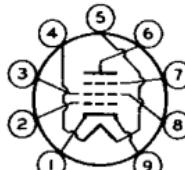

Characteristics, Class A₁, Amplifier:

Heater Voltage	13.5	volts
Plate Voltage.	250	volts
Grid No.3.	Connected to cathode at socket	
Grid-No.2 Voltage.	250	volts
Grid-No.1 Voltage.	-18	volts
Mu-Factor, Grid No.2 to Grid No.1.	8.7	
Transconductance	5300	μhos
Plate Current.	40	ma
Grid-No.2 Current.	3	ma

Mechanical:

Operating Position	Any
Maximum Overall Length	2-5/8"
Maximum Seated Length.	2-3/8"

- Without external shield.
- ◆ Subscript 1 indicates that grid-No.1 current does not flow during any part of the input cycle.
- Continuous Commercial Service.
- Averaged over any audio-frequency cycle of sine-wave form.
- § Obtained preferably from a fixed supply.
- † Key-down conditions per tube without amplitude modulation. Amplitude modulation essentially negative may be used if the positive peak of the audio-frequency envelope does not exceed 115% of the carrier conditions.
- ◆ Intermittent Commercial and Amateur Service.
- Obtained preferably from a separate source or from the plate-voltage supply with a voltage divider. If a series resistor is used, it should be adjustable to obtain the desired operating plate current after initial tuning adjustments are completed.
- ** Obtained from a grid-No.1 resistor or from a combination of grid-No.1 resistor with either fixed supply or cathode resistor.
- ▲ Driver stage is required to supply tube losses and rf-circuit losses. The driver stage should be designed to provide an excess of power above the indicated values to take care of variations in line voltage, components, initial tube characteristics, and tube characteristics during life.
- * Measured at load.
- ▲ Obtained preferably from a separate source modulated along with the plate supply, or from the modulated plate supply through a series resistor. It is recommended that this resistor be adjustable to obtain the desired operating plate current after initial tuning adjustments are made.

- * Obtained from a grid-No.1 resistor or from a combination of grid-No.1 resistor with either fixed supply or cathode resistor. The combination of grid-No.1 resistor and fixed supply has the advantage of not only protecting the tube from damage through loss of excitation but also of minimizing distortion by bias-supply compensation.

SPECIAL RATINGS & PERFORMANCE DATA

Heater-Cycling Life Performance:

This test is performed on a sample lot of tubes from each production run. A minimum of 2000 cycles of intermittent operation is applied under the following conditions: Heater voltage of 17 volts cycled one minute on and two minutes off, heater = 135 volts negative with respect to cathode, and all other elements connected to ground. At the end of this test, tubes are checked for heater-cathode shorts and open circuits.

Low-Frequency Vibration Performance:

This test is performed on a sample lot of tubes from each production run under the following conditions: Heater

7551

7551

BEAM POWER TUBE

voltage of 13.5 volts, plate voltage of 250 volts, grid-No.2 voltage of 250 volts, grid-No.1 voltage of -18 volts, plate load resistor of 2000 ohms, and vibrational acceleration of 2.5 g at 25 cps. In this test, the rms output voltage must not exceed 200 millivolts.

500-Hour Intermittent Life Performance:

This test is performed on a sample lot of tubes from each production run to insure high quality of the individual tube and to guard against epidemic failures. Life testing is conducted under the following conditions: Heater voltage of 15 volts and at maximum rated plate dissipation and grid-No.2 input.
