

Amperex® ELECTRONIC CORPORATION
HICKSVILLE, L. I., N. Y., 11802

TUBE TYPE

8637

The Amperex 8637 is a radiation cooled beam power twin tetrode having high thermal inertia anodes capable of handling the peak dissipation encountered under PTTS service. It is designed for use as an RF power amplifier, oscillator and frequency multiplier in mobile and base station equipment up to 175 MHz. It uses a glass envelope and an indirectly heated cathode. Built in cross neutralization is effective over the entire operating band. It is capable of producing 63 watts from 2.2 watts drive power as a 175 MHz amplifier under PTTS conditions. The 8637 is also rated for class AB₁ SSB service.

TYPICAL OPERATING CHARACTERISTICS

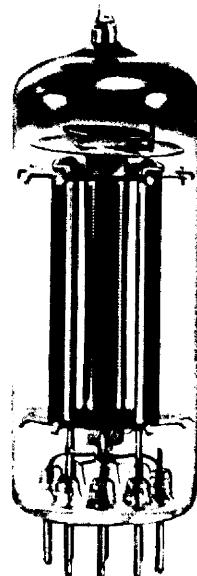

Frequency	Class C Telegraphy		Class C Telephony		Class AB ₁ (SSB)	
MHz	Eb(V)	Po(W)	Eb(V)	Po(W)	Eb(V)	Po(WPEP)
7 PTTS	--	--	--	--	600	60*
175 PTTS	560	63	450	42	--	--

*Third order IM Distortion = -34 db

GENERAL CHARACTERISTICS

MECHANICAL

Dimensions see outline drawing
Mounting Position any
Net Weight 1.4 ounces
Base 9 pin magnoval
Cooling¹ radiation and convection
Absolute Maximum Operating Temperature

ELECTRICAL

Cathode coated unipotential
Heater
 Voltage 13.5 volts
 Current .80 amperes
 Maximum Heater to Cathode Voltage ±100 volts
Amplification Factor (Grid #1 to Grid #2)
 Each unit at Ib = 30 ma
Direct Interelectrode Capacitance
 Input 9.3 pf
 Output 4.2 pf
 Grid to Plate - Maximum 0.2 pf

1. Sufficient cooling must be applied to the bulb and seals to avoid exceeding rated maximum temperature. The use of a closed can closer to the bulb than 1/2 inch is not recommended.
2. Socket number listed is for mounting on top of chassis. Socket #B8.702.16 is for mounting on bottom of chassis.

-
3. Push-To-Talk (PTTS) Service describes an operating cycle of one minute ON (Maximum) and four minutes OFF (Minimum) without impairing the long useful life of this tube. This tube is also capable of being continuously operated under these conditions for reasonably extended periods of time to permit equipment tuning and adjustment.

Fifth Order	-44	-41	-47	db

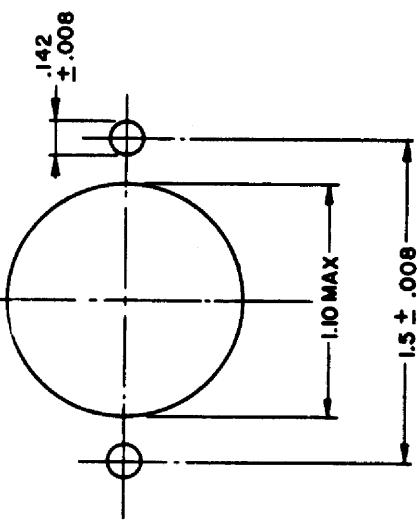

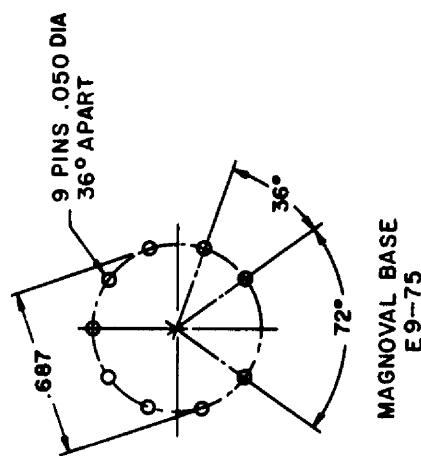

⁴ Approximate value. Voltage used should be that which results in specified zero signal plate current.⁵ Push-to-talk (PTTS) Service describes an operating cycle of one minute ON (maximum) time and four minutes (minimum) OFF time which does not impair the long useful life of the tube. OFF time refers to the condition where no cathode current is flowing within the tube and not to the zero signal condition. A method of accomplishing this would be the use of "vox" or similar circuitry.
