NOTES:

1. Heater warm-up time is defined as the time required for the voltage across the heater to reach 80% of the rated heater voltage after applying four (4) times rated heater voltage to a circuit consisting of the tube heater in series with a resistance equal to three (3) times the rated heater voltage divided by the rated heater current.
2. For operation in a 525-line, 30-frame system as described in "Standards of Good Engineering Practice for Television Stations; Federal Communications Commission."
3. In stages operating with grid-leak bias, an adequate bias resistor or other suitable means is required to protect the tube in the absence of excitation.

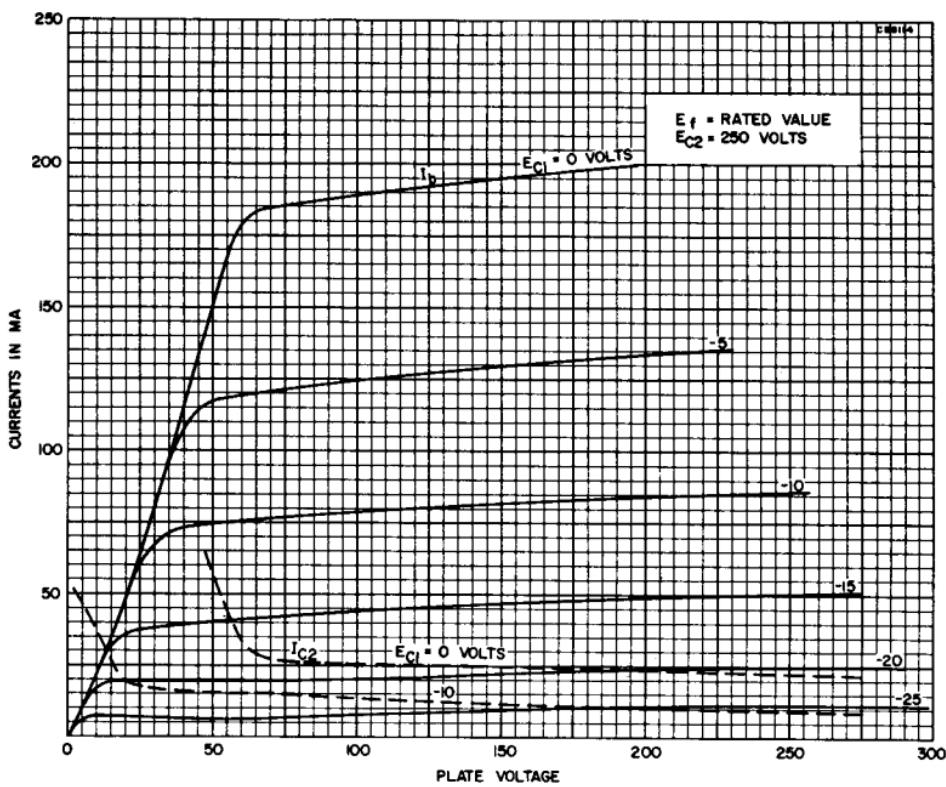

APPLICATION

The Sylvania Types 6EM5 and 8EM5 are miniature beam power tubes designed primarily for vertical deflection amplifier service in television receivers employing 110° deflection systems.

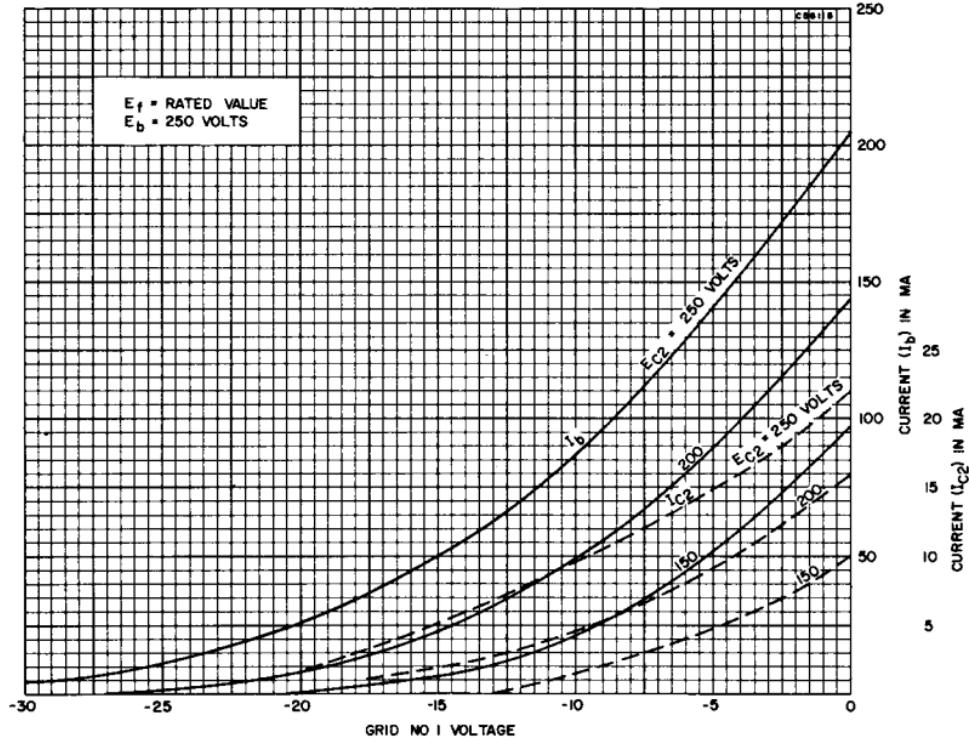

The 8EM5 features controlled heater warm-up time for operation in receivers employing a series heater string.
