\*Averaged over any audio-frequency cycle.

\*\*At crest of A.F. cycle with modulation factor of 1.0.

†The temperature of the radiator must be measured in the thermometer well. A vertical air flow of 500 cubic feet per minute with an incoming temperature of not over 45°C. is required. The bulb must be cooled by a downward air flow of 15 cubic feet per minute from a 3-inch diameter nozzle. The glass temperature must not exceed 150°C. at any point.

‡This tube can usually be operated with reduced filament voltage when the load conditions are lower than maximum.

§Modulation, essentially negative, may be used if the positive peak of the audio-frequency envelope does not exceed 115% of the carrier conditions.
