Cathode Resistor . . . . .	1500	820 Ohms
Transconductance . . . . .	1800	2500 $\mu\text{hos}$
Amplification Factor . . . . .	70	70
Plate Current . . . . .	0.8	1.75 mAdc
Grid Voltage for Ib $\pm$ 50 $\mu\text{Adc}$ Max. . . . .	-2.8	-3.7 Vdc

### NOTES:

1. Limitations beyond which normal tube performance and tube life may be impaired.
2. If altitude rating is exceeded, reduction of instantaneous voltages (Ef excluded) may be required.
3. Tube life and reliability of performance are directly related to the degree of regulation of the heater voltage to its center rated value of 6.3 volts.
4. External shield of 0.405 inch diameter connected to cathode.
5. Values shown are as registered with RETMA.
6. Per MIL-E-1C par. 6.5 and General Section of this Sylvania Subminiature Tube Manual titled Specifications and Ratings.

## QUICK REFERENCE DATA

The Premium Subminiature Type 6112 is a high mu double triode having separate cathode connections for each section. It is intended primarily for use in low level audio circuits and is designed to provide dependable service under conditions of severe shock, vibration, high temperature and high altitude. The 6112 is manufactured and inspected to meet the applicable MIL-E-1 specification for reliable operation.

### ACCEPTANCE CRITERIA NOTES:

- The AQL for the combined defectives for attributes in Measurements Acceptance Tests, Part 1, excluding inoperatives and mechanical shall be one (1) percent. A tube having one (1) or more defects shall be counted as one (1) defective.
- Tubes subjected to the following destructive tests are not to be accepted under this specification.
  - 4.9.5.3 Subminiature lead fatigue
  - 4.9.20.5 Shock
  - 4.9.20.6 Fatigue
  - 4.11.7 Heater cycling life test
  - 4.11.5 Intermittent life test
- Envelope temperature is defined as the highest temperature indicated when using a thermocouple of #40 BS or smaller diameter elements welded to a ring of 0.025 inch diameter phosphor bronze placed in contact with the envelope. Envelope temperature requirement will be satisfied if a tube, having bogey Ib ( $\pm 5\%$ ) under normal test conditions, is determined to operate at maximum specified temperature at any position on the life test rack.
- Test each section separately.
- Prior to this test tubes shall be preheated five (5) minutes with both sections operating separately at conditions indicated below. Test within three (3) seconds after preheating. Three-minute test is not permitted. Grid Emission shall be the last test performed on the sample selected for the Grid Emission Test.

V	Vdc	Vdc	Ohms	Meg
7.5	0	150	820	1.0

### APPLICATION DATA

The Sylvania Premium Subminiature Type 6112 is a high mu, double triode of subminiature construction intended primarily for application as a low level, resistance coupled amplifier. In such circuits the high mu (70) of the 6112 can easily yield a voltage gain of 50 for each section. Resistance coupled amplifier data is shown in the accompanying tables for both cathode bias and zero bias operation. In zero bias circuits a grid circuit resistance of from 5 to 10 megohms should be employed to reduce contact potential loading and provide better plate current balance between sections and/or individual tubes.

Electrically, the 6112 is essentially equivalent to two Type 5719's in one envelope. The 6112 is particularly useful in applications where the power requirements permit the use of two tubes in one envelope.

To insure correlation with actual field conditions and thereby enhance equipment reliability, vibrational noise output is controlled by the "white noise test" as shown in the acceptance criteria. Briefly, this test consists of subjecting the tubes to a white noise vibration spectrum covering the frequency band of 100 to 5000 cps at a rms level of 2.3 g's per octave and a peak level of 15 g's. Limits are shown for both peak and rms output. A fur-

$$G_{rms} = 2.3 G \sqrt{3.32 \log_{10}(f_2/f_1)}$$

f<sub>2</sub> and f<sub>1</sub> are the upper and lower frequencies respectively of the band under consideration. The degree of clipping of the peak accelerations shall be such that the peak value of acceleration is at least 15 G's.

The voltage (ep) produced across the resistor (Rp) as a result of vibration shall be coupled through a compensating amplifier to a low pass filter. The compensating amplifier shall have a high input impedance (0.25 megohm or more) and shall be adjusted to compensate for any insertion losses in the filter. The combined frequency response of amplifier and filter shall be flat within  $\pm 0.5$  db from 50 cps to 8000 cps, shall be down no more than 5 db at 10,000 cps and at 20 cps, and down at least 40 db at 13,000 cps. For reading the peak to peak value of output voltage the filter output shall be fed directly to the input of a Ballantine Model 305 peak to peak electronic voltmeter or equal, while the rms value shall be measured with a Hewlett-Packard Model 400C or equal.

## APPLICATION DATA (Continued)

ther discussion of the white noise vibrational test is included in the frontal section of this manual.

Life expectancy is described by the life tests, specified on the attached pages and/or individual MIL-E-1 specifications. The actual life expectancy of the tubes in an operating circuit is affected by both the operating and environmental conditions involved. Likewise, the life tests specified indicate performance under certain operating criteria to a set of specified end points. Performance at conditions other than those specified can usually be estimated only roughly as giving better or poorer life expectancy. For further discussion of life expectancy,

reference should be made to the frontal section of this manual.

The 6112 is manufactured and inspected to meet the applicable MIL-E-1 specification for reliable operation and is intended for service under conditions of severe vibration, shock, high temperature and high altitude.

When operated under conditions common to on-off control applications the tube exhibits freedom from the development of interface resistance. The heater-cathode construction is designed to withstand intermittent operation.
