Planar Triode

6299

FOR GROUNDED-GRID CLASS A UHF AMPLIFIER APPLICATIONS

The 6299 is a high- μ , metal-and-ceramic triode intended for operation as a grounded-grid, Class A radio-frequency amplifier at frequencies as high as 3000 megacycles.

Features of the tube include small size, planar electrode construction with close spacing, inherent rigidity, and an envelope structure convenient for coaxial circuit applications.

At 1200 megacycles a noise figure of less than 8.5 decibels may be obtained when the 6299 is used in a grounded-grid coaxial circuit.

In radar receivers, or similar applications, where the grid of the tube may be driven positive by leakage pulses, consideration should be given to use of the 7644 in place of the 6299.

Negative DC Grid Voltage	15	Volts
Plate Dissipation	2.0	Watts
DC Plate Current.	12	Milliamperes
DC Grid Current#.	0Δ	Milliamperes
Envelope Temperature at Hottest Point.	150	C

Absolute-Maximum ratings are limiting values of operating and environmental conditions applicable to any electron tube of a specified type as defined by its published data and should not be exceeded under the worst probable conditions.

The tube manufacturer chooses these values to provide acceptable serviceability of the tube, making no allowance for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the tube under consideration and of

all other electron devices in the equipment.

The equipment manufacturer should design so that initially and throughout life no absolute-maximum value for the intended service is exceeded with any tube under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations in the characteristics of the tube under consideration and of all other electron devices in the equipment.

The tubes and arrangements disclosed herein may be covered by patents of General Electric Company or others. Neither the disclosure of any information herein nor the sale of tubes by General Electric Company conveys any license under patent claims covering combinations of tubes with other devices or elements. In the absence of an

express written agreement to the contrary, General Electric Company assumes no liability for patent infringement arising out of any use of the tubes with other devices or elements by any purchaser of tubes or others.

NOTES

- * The equipment designer should design the equipment so that heater voltage is centered at the specified bogey value, with heater supply variations restricted to maintain heater voltage within the specified tolerance.
 - # Heater current of a bogey tube at $E_f = 6.3$ volts.
 - § Without external shield.
 - ¶ Good thermal contact to the anode and cathode must be provided to conduct heat from the elements. The anode contact must be sufficiently flexible to keep lateral force on the anode terminal at a minimum.
 - # The 6299 is rated only for Class A amplifier service.
 - △ Does not apply to initial-emission-velocity current.
 - ¢ Adjusted for $I_b = 10$ milliamperes.
 - ** Adjust for $I_b = 10$ milliamperes; range must be variable from 75 to 200 volts.
 - ## Supply should be regulated.
 - §§ For operation above 1000 megacycles, the minimum noise figure will generally be obtained by operation at zero bias. For operation below 1000 megacycles, the use of a cathode resistor or grid bias should be evaluated for the particular application.
 - ¶¶ Adjusted for $I_b = 10$ milliamperes; 200 ohm variable cathode resistor recommended.

INITIAL CHARACTERISTICS LIMITS

		Min.	Bogey	Max.	
Heater Current					Milliamperes
Ef = 6.3 volts 280	300	320	
Plate Voltage					Volts
Ef = 6.3 volts, Ec = 0 volts, Eb adjusted for Ib = 10 ma 75	125	175
