

# Mullard TELEVISION TUBE

M46-15

## Cathode Ray Tube for Television Reception

### 15-INCH SCREEN

#### HEATER CHARACTERISTICS

Heater Voltage	...	...	...	...	Vf	= 4.0 volts
Heater Current	...	...	...	...	If	= 1.2 amps

#### OPERATING CHARACTERISTICS

Second Anode Voltage	...	...	...	...	Va2	= 4,000-5,000 volts
First Anode Voltage	...	...	...	...	Va1	= 250 volts
*Grid Voltage	...	...	...	...	Vg	= 0.60 volts
Cathode internally connected to Heater—						
Electromagnetic Deflection Sensitivity	...				Y = $\sqrt{\frac{16L}{Va2}}$ mm. per Gauss.	

(Where L is the length of deflection zone in millimetres and Va2 the second anode voltage.)

Ampere turns for focusing coil ... ... ... = 500 A.T.

#### INPUT CAPACITY

Grid to all other Electrodes	...	...	...	Cg	= 6.0 $\mu\mu$ F
------------------------------	-----	-----	-----	----	------------------

#### FLUORESCENT COLOUR

White.

#### DEFLECTION

Double Electromagnetic

#### LIMITS

Maximum Second Anode Voltage	...	...	Va2 <sub>max</sub>	= 6,000 volts
Maximum First Anode Voltage	...	...	Va1 <sub>max</sub>	= 250 volts

\* The Grid Voltage should be adjusted to give the required light intensity. The voltage should never become positive or damage to the tube will result.
