

THE trustees of the Massachusetts Agricultural College have established a department of zoology and geology with Mr. C. E. Gordon as its head.

DR. BIRD T. BALDWIN, who for the past year was a lecturer in the University of Chicago, has accepted a call to an associate professorship in education and head of the school of practise teaching in the University of Texas.

DR. FREDERICK P. GAY, of the Harvard Medical school, has been appointed head of the department of pathology of the University of California. Dr. H. B. Graham, who recently returned to Berkeley from Austria, has been appointed assistant professor of hygiene.

DR. F. L. HALEY, of Hoosick Falls, N. Y., has been made professor of physiologic chemistry and bacteriology in the medical department of the University of Alabama. Other additions to the faculty are: Dr. James F. Harrison, professor of chemistry and materia medica; Dr. M. Toulmin Gaines, associate professor of pathology and histology, and Dr. William H. Oates, associate professor of therapeutics.

DISCUSSION AND CORRESPONDENCE

THE LUMINOSITY OF TERMITES

IN SCIENCE of January 7, 1910, I published a note in regard to the luminosity of termites. To that communication I am now able to make the following additions. Herbert H. Smith, a thoroughly trustworthy naturalist, makes the following note at page 139 of his work on "Brazil, the Amazons, and the Coast," New York, 1879:

There are white ant-hills along the sides—pale glows of phosphorescent light, like coals in the ashes. They look ghostly in the darkness.

In a footnote he adds:

The phosphorescence is in the insects; and I believe that it is peculiar to one or two forest species.

The locality where Mr. Smith observed this phosphorescence is near Santarem in the valley of the Tapajos.

Bearing on the other side of the question I here give a translation of a letter just received from my friend Dr. Joaquim Lustosa, a

Brazilian mining engineer living at Lafayette, state of Minas Geraes, of whom I have made inquiries about this matter. Dr. Lustosa writes as follows under date of July 8, 1910:

I have just received authentic information to the effect that in the state of Matto Grosso, in the low swampy lands along streams, and especially in the rainy months beginning with October myriads of fireflies are seen covering the ground. My informant, who has lately come from the upper part of Matto Grosso where it joins Bolivia, tells me that he has seen at night many of the nests of white ants that have been abandoned by the ants themselves entirely covered by fireflies that come from the small openings over the whole surface of the anthill. Is it possible that the fireflies select these abandoned anthills as places in which to rear their larvæ? . . . Unfortunately, I have never observed anything of the kind hereabout, though I have been interested in the subject in order to furnish you information.

It should be noted that the case mentioned by Dr. João Severiano da Fonseca and referred to in my communication of December 13, 1909, was seen in Matto Grosso in the region mentioned by Dr. Lustosa.

HONEY ANTS IN UTAH

IN the autumn of 1908, Mr. Guy Hart, a student in the Salt Lake High School, brought to me for identification some of the repletes of the honey ant. He had collected them at Garfield, Utah, a smelter town at the southern end of Great Salt Lake. They had been found while excavating for a house, and Mr. Hart said that they had been noticed on several occasions during the progress of excavations.

I sent a few of these repletes to Professor W. M. Wheeler, and he determined them as a variety of *Myrmecocystus mexicanus*. This variety is closely related to *horti-deorum*, but the repletes are somewhat smaller than those of that variety.

Garfield is at an elevation of about 4,243 feet. Its latitude is approximately 40° 42' N. Honey ants have not heretofore been reported
