New York City: Grand Central Terminal.  
Annual Subscription, \$6.00. Single Copies, 15 Cts.

SCIENCE is the official organ of the American Association for the Advancement of Science. Information regarding membership in the association may be secured from the office of the permanent secretary, in the Smithsonian Institution Building, Washington, D. C.

Entered as second-class matter July 18, 1923, at the Post Office at Lancaster, Pa., under the Act of March 3, 1879.

## THE RÔLE OF EPITHELIUM IN EXPERIMENTAL IMMUNIZATION<sup>1</sup>

SOME twelve years ago I became impressed with the idea that the surface epithelium of the body, including the epidermis and the succulent coverings of the respiratory and alimentary canals, must have important functions in mediating between foreign material brought in contact with it and the internal tissues which it covers.<sup>2</sup>

From either a physiological or pathological point of view the surface epithelium forms the "first line of defense" of the body.

Our modicum of knowledge respecting the protective attributes of this covering embraces two certainties—that it is a mechanical barrier intervened to the passage of foreign material, especially when particulate; and that, when part of a mucous membrane, it is a metabolizing organ capable of chemically changing foreign substances in contact with it.

And yet, in the vast majority of experiments designed to elucidate the reactions of the living tissues toward such materials, these are introduced by traumatic methods avoiding the first line of defense.

An animal might conceivably live long without ever suffering a lesion through which foreign matter might be absorbed, but no mammal has ever escaped the necessity of swallowing or inhaling extraneous substances, including proteins which act as antigens when introduced as such within the body.

The following observations are concerned in no way with reactions of the alimentary canal but only with the mucous membrane of the nasal chambers.

The fact is sufficiently extraordinary that, in the healthy subject, the epithelium of the lungs and bronchi is free from microorganisms, untold numbers of which daily enter the nose. What has become of them? What chemical changes have attended their destruction? What tissue reactions have answered the absorption of such foreign proteins or their digested products?

It seems plausible that "natural immunity" might find its extraneous stimulus in such conditions of antigenic absorption.

For three years, with the invaluable cooperation of my colleague, Dr. Cuthbert Powell, I sought to outline experimentally the immunological attributes of the

# BAUSCH & LOMB

## BINOCULAR MICROSCOPE FFSE—8

**I**NTERCHANGEABILITY of binocular body tube with monocular tube is one of the features of this simplified model of parallel tube type binocular microscope. All optics are of the highest quality,—exactly the same as are used on more expensive models.

The equipment includes:—

**Achromatic Objectives—**  
10x(16mm), 45x(4mm)  
and 97x(1.9mm Oil Im-  
mersion).

**Paired Huygenian Eye-  
pieces—**5x and 10x.

**Parallel Eyepiece Tubes**  
—adjustable for inter-  
pupillary distance.

**Abbe Condenser—**N. A.  
1.20.

**Adjustable Substage** of  
the quick acting screw  
type.

**Side Fine Adjustment—**  
Bausch & Lomb patented  
lever type; movement in  
same direction as coarse  
adjustment; equipped  
with automatic take-up  
for wear.

*Price, as illustrated and  
described, \$190.00*

# LEITZ

**Micro-  
Camera**

**Attach-  
ment**

**"MICCA"**

**Features:**

1. This attachment adapts any microscope for photo-micrographic work;
2. It is inserted in place of the Ocular;
3. Side-Observation-Telescope permits examination during exposure;
4. The image as focused through the telescope appears equally sharp on the ground glass screen or plate respectively;
5. It permits the demonstration of projected images in classrooms;
6. It is provided with time and instantaneous shutter;
7. It can be used with plates or films;
8. Entire weight 220 grams.

The Camera Attachment "Micca" represents a small but most efficient Photo-Micrographic Camera, ready for use without time-consuming preparations, and permits to speedily record any image viewed under the microscope.
