SCIENCE is the official organ of the American Association for the Advancement of Science. Information regarding membership in the Association may be secured from the office of the permanent secretary, in the Smithsonian Institution Building, Washington, D. C.

## THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

### PRELIMINARY ANNOUNCEMENT OF THE ROCHESTER MEETING

Edited by Dr. HENRY B. WARD

PERMANENT SECRETARY

ROCHESTER, NEW YORK, is to welcome the association on Tuesday, June 16, 1936, for a three-day session, terminating there on Thursday evening, June 18, when the association adjourns to convene again the following day in Ithaca for the remainder of the summer meeting. This unusual arrangement was entered into because of the semi-centennial of Sigma Xi, which had invited the association to designate this event as an integral part of the summer meeting for 1936. This is the ninety-eighth meeting of the association and the second to be held in Rochester, for the forty-first meeting in August, 1892, was in the same city. It is also the second to be held at Ithaca, as the fifty-sixth meeting was held there in June, 1906.

The first meeting in Rochester was held in August, 1892, and was the forty-first in the record of the association. On that occasion three famous geologists are listed among the officers of the meeting: Professor Joseph Le Conte, of the University of California, was president of the association; among the vice-presidents was Professor H. S. Williams, of Cornell, often spoken of as the founder of Sigma Xi, and Professor H. L. Fairchild served as local secretary. For the coming meeting Professor Fairchild has been given the place of honorary chairman; Professor J. Edward Hoffmeister is chairman, Dr. W. R. Line, secretary, and R. L. Thompson, treasurer. On the general committee some thirty members of the faculty of the University

**Eames—MORPHOLOGY OF VASCULAR PLANTS.****Lower Groups—Psilophytales to Filicales**

By ARTHUR J. EAMES, Professor of Botany, Cornell University. *McGraw-Hill Publications in the Agricultural and Botanical Sciences.* 420 pages, \$4.00

This advanced textbook covers the morphology and life histories of vascular plants. Emphasis is placed upon broad comparative studies of the various groups with the development of a natural classification and of phylogenetic relationships as a goal. Facts are presented as a basis for the determination of morphological principles and for the building up of a natural classification. Classification is built up as group is compared with group, and a complete classification is attained only at the end of the book. Much attention is given to recently acquired information, particularly that concerning fossil groups.

**Hill, Overholts and Popp—BOTANY. A Textbook for Colleges**

By J. BEN HILL, LEE O. OVERHOLTS and HENRY W. POPP, Department of Botany, The Pennsylvania State College. *McGraw-Hill Publications in the Agricultural and Botanical Sciences.* 655 pages, \$4.00

Throughout the first part of this new book, the physiology of an organ is considered in connection with its structure in general. In Part II, devoted entirely to a consideration of the different groups of plants, the authors give an adequate and balanced survey of the plant kingdom without undue emphasis on any one group. Clear, complete explanations without oversimplification are a most important feature of the book. Special attention is given to growth and metabolism and stress is laid on the physiological importance of color. The book is up to date, presenting the latest developments on the life history of the lily and the life history of the pine.

**BIOLOGICAL EFFECTS OF RADIATION. Mechanism and Measurement of Radiation, Applications in Biology, Photochemical Reactions, Effects of Radiant Energy on Organisms and Organic Products**

Edited by BENJAMIN M. DUGGAR, Professor of Plant Physiology and Applied Botany, University of Wisconsin. With contributions by 46 specialists. Prepared under the auspices of the Committee on Radiation, Division of Biology and Agriculture, National Research Council. Two volumes (not sold separately), 1342 pages, \$12.00

Presents a fundamental survey of the effects of radiant energy on the processes, development, heredity, and more important products of plants and animals. Each of the forty-three chapters is the work of one or more specialists in the subject it covers.
