

by the Engineering Council for Professional Development and by the American Institute of Chemical Engineers.

Professor Rhodes, the first director, received the degree of Ph.D. from Cornell University in 1914. After several years spent in teaching at the University of Montana and Cornell University, he was research chemist and chemical engineer and director of research of the chemical department of the Barrett Company. He also acted as consultant for the Anaconda Copper Company, the Atlantic Tar and Chemical Company and other industrial concerns. He designed the refined products section of the main tar refinery of the U. S. Steel Corporation at Clairton, Pa. Since 1920 he has been professor of chemistry and chemical engineering at Cornell and has been chairman of the committee supervising the curriculum in chemical engineering since its establishment.

AWARD OF THE LAMME MEDAL OF THE AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS

THE 1937 Lamme Medal of the American Institute of Electrical Engineers has been awarded to Dr. Robert E. Doherty, president of the Carnegie Institute of Technology, Pittsburgh, Pa., "for his extension of the theory of alternating current machinery, his skill in introducing that theory into practice and his encouragement of young men to aspire to excellence in this field." The medal and certificate will be presented to him at the annual summer convention of the institute, which is to be held in Washington, D. C., from June 20 to 24.

The Lamme Medal was founded as a result of a bequest of the late Benjamin G. Lamme, chief engineer of the Westinghouse Electric and Manufacturing Company, who died on July 8, 1924, to provide for the award by the institute of a gold medal (together with a bronze replica thereof) annually to a member of the American Institute of Electrical Engineers, "who has shown meritorious achievement in the development of electrical apparatus or machinery" and for the award of two such medals in some years if the accumulation from the funds warrants. A committee composed of nine members of the institute awards the medal. Mr. Lamme made similar bequests to the Society for the Promotion of Engineering Education and to the Ohio State University.

Dr. Doherty was born in Illinois in 1885. He completed his secondary education at the academy of the University of Illinois, and later entered the university, from which he received the bachelor of science degree in 1908. Before he entered the University of Illinois he served for two years as a telegraph operator with the Baltimore and Ohio Railroad. After graduation he was employed as a student engineer by the General

Electric Company and was later appointed designing engineer. In 1923 he was appointed consulting engineer for the General Electric Company, and after two years was selected to organize the advanced course in engineering offered by the company. He was also given the responsibility for educational work among the young college graduates that were employed and trained by the firm. In 1931 he was appointed professor of electrical engineering at Yale University, becoming head of the School of Engineering in 1933. Since becoming president of the Carnegie Institute in 1936 he has worked with his associates in reorganizing the curriculum of the College of Engineering.

Dr. Doherty has taken an active part in the educational programs of the professional societies. He was chairman of the committee on education of the American Institute of Electrical Engineers, 1931-33, and has served as a member of several of its committees. In 1934 he was appointed chairman of a committee of the Society for the Promotion of Engineering Education for studying objectives and length of curriculum in engineering colleges.

AWARD OF THE WILLARD GIBBS MEDAL

DR. ROBERT R. WILLIAMS, of New York, chemical director of the Bell Telephone Laboratories, has been awarded the Willard Gibbs Medal of the Chicago Section of the American Chemical Society, one of the highest scientific honors bestowed in the United States, for "outstanding work in connection with the study and isolation of the beri-beri vitamin." Dr. Williams announced the discovery of the chemical structure of vitamin B₁, the antineuritic vitamin now called thiamin, in January, 1935. He characterized the achievement as a "preeminently cooperative enterprise" climaxing "nearly forty years of effort by scores of workers in many lands." He himself had sought isolation of the vitamin for twenty-five years, having begun his experiments in the Philippines in 1910.

By synthesizing the beriberi vitamin, Dr. Williams made it available to research workers for the first time. Patents concerned with the process of manufacture of synthetic vitamin B₁ have been assigned to the Research Corporation, New York. Under license from this corporation, the vitamin is being produced commercially on a substantial scale and is being distributed by many of the prominent drug firms of the country. The Research Corporation is a non-profit organization dedicated to the management of patented processes and utilizes the proceeds for the support of scientific research.

Dr. Williams was born in Nellore, India, of American parents, on February 16, 1886. He was a student at Ottawa University, Kansas, and at the University of Chicago, from which he received the bachelor of
