TUNNEL CLAMP

FOR HOSPITAL AND LABORATORY

Rate of infusion accurately controlled

One-half the actual size

Delicate adjustment of flow in intravascular infusions is afforded by the Shannon-Bradley device for compressing the rubber tube over a relatively long segment. It has proved of special value where extremely slow input is required (e.g. 1 to 2 cc. per minute) for long periods, as in *penicillin* administration.

The material is brass, heavily nickered, permitting sterilization. Compression plate is assured steady contact with adjusting screw by springs acting on the two guide-pins, and the removable sliding cover is so flanged as to resist deformation of the casing during compression. A side-rod is provided for fixation to a rigid upright by means of our Heavy Clamp, or similar device for firm attachment.
