## NOW Completely Automatic—Liquid Scintillation Counting

NEW

provides all of the advantages of liquid scintillation counting

- sensitivity
- simplicity of operation
- versatility
- ease of sample preparation

PLUS ★ completely automatic operation up to 100 samples

Counting Tritium, Carbon-14, and other beta emitting isotopes by the Tri-Carb Liquid Scintillation Spectrometer Method offers many advantages over older methods such as Geiger and proportional counting.

Sensitivity can be shown by noting one extreme condition: natural radiocarbon dating can be extended beyond 40,000 years.

Simplicity of operation can be shown by the other extreme: hundreds of moderately active samples can be counted daily.

Versatility is indicated by the fact that this is a method of spectrometry. Pulse height analysis permits selection of the most favorable sample and background conditions. Also, two or more beta emitting isotopes of different energies can be selectively counted in a single sample.

Ease of sample preparation is one of the most popular features. Besides samples that are readily soluble in toluene, such things as aqueous samples, carbon dioxide, and completely insoluble solid samples can also be counted.

Automation now further enhances the advantages of the Tri-Carb Method. Up to 100 samples can be handled completely automatically, with the original data accurately and permanently recorded on paper tape. The instrument can be utilized to the fullest extent—24 hours per day—without consuming valuable staff time.

Important to present and prospective users of Tri-Carb Spectrometers:

The automatic sample handling equipment and the printing readout are both designed to be compatible with all Tri-Carbs. Thus existing models, as well as all new manual models, can be converted to automatic operation at any time in the future.

# Kodak reports to laboratories on:

four new sensitizings for an expanding universe . . . two new thermosetting optical cements . . . some dry and scarcely credible dark violet prisms

## Finesse and sensitivity

Here we are, seemingly hoist in the dark with our own photographic petard, while in the act of coating photographic emulsion on glass to keep the astronomers in business. Since the world's professional astronomers could all be comfortably accommodated in the stands of even a smallish town's ball park, the coating equipment we maintain for their benefit need not be very streamlined. It must, however, be very good, lest precious hours be wasted for magnificent instruments and men who have so much probing of the universe to cram into too brief lifetimes.

Photographic emulsion, the heart of the matter, comes here in beakers—a little beaker to coat a couple of dozen 2 by 10's, a bigger beaker for a dozen dozens of 8 by 10's to go to a man who wants to make sure his whole autumn's observing program will be on the same coating. This is custom manufacturing, of course. Up to now we have listed 104 combinations of emulsion types and spectral sensitizing classes in which we can make Kodak "Spectroscopic" Plates, as these esoterica are trademarked. Occasion for the present remarks is the addition of four sensitizing classes for *Emulsion Type Ila*.

The lower case "a" means that the sensitivity emphasis has been so

applied as to require the fewest hours of exposure to make visible the incredibly faint rather than to freeze a split microsecond with the least burst of brilliance. For building up something in the way of image out of virtually nothing in the way of energy flow, there is an *Emulsion Type 103a* that is even more sensitive. *Ila*, however, beats it for fine image structure and signal-to-noise ratio in the microphotometer tracings of stellar and galactic spectra.

The new *Ila* sensitizings are *Class F*, a very uniform one for the whole visible spectrum, especially for the red to 680  $m\mu$ ; *Class E*, with low green sensitivity but the highest total red sensitivity, peaking at about 645  $m\mu$  and cutting off sharply beyond about 660  $m\mu$ ; *Class D*, the most generally useful one for the green region to about 630  $m\mu$ ; and *Class G*, which provides the highest green sensitivity obtainable without appreciable red sensitivity.

*Astronomers and others who employ photographic sensitivity with this order of finesse conduct their negotiations for materials with Special Sensitized Products Sales Division, Eastman Kodak Company, Rochester 4, N. Y., which arranges for delivery through Kodak dealers—the very same, in many cases, who supply portrait photographers with Kodak Opal Paper on which to picture the local brides. This also requires finesse and sensitivity.*

## What's wrong with Canada balsam?

We seem to have achieved a lonely leadership in the manufacture of optical cements. The eminence is not altogether enviable. It's hard to make money at selling optical cement to other optical manufacturers, nor is there in it the kind of satisfaction to be found, for example, in making ever better photographic plates for astronomers to use in exploring the universe. (There isn't any money in that either, but it's fun and it sharpens the skills.) Lens cement, however, is only lens cement. What if it does hold lenses or prisms together over a much wider range of tempera-

tures than the old Canada balsam used to? After all, our resin chemists and our optical production engineers get the same signature on their pay checks.

*We have two new thermosetting optical cements that we might as well share with the world. \$54 a pound for the syrupy-liquid HE-63 that requires alignment fixtures during polymerization; \$175 per half-pound for the gelatinous HE-65 that usually needs no fixture for interfaces up to one square inch. For use directions and information about several other types we make, write Eastman Kodak Company, Special Products Division, Rochester 4, N. Y. A half-pound of lens cement goes a long, long way; if you don't want that much, we beg to remind you that opticians have gotten along with Canada balsam for many years, even though we don't sell it.*

## A scoop for radicals

"I have in my hand a little bottle which contains some dry, dark violet prisms of a free radical," you will casually remark to acquaintances and students suspected of being unfamiliar with *J.A.C.S.*, 72, 1051; *J. Org. Chem.*, 17, 1437; or *J. Chem. Soc.*, 1954, 3574 and 1956, 1127. It will be diphenylpicrylhydrazyl. You will have made it by treating *1,1-Diphenyl-2-picrylhydrazine* (Eastman 7365) with lead peroxide in chloroform. It will keep on the shelf for a while but not long enough for us to have relieved you of the preparation chore. Being reasonably inert to molecular oxygen, it will make a very fine scavenger with which to scoop other, less long-lived free radicals out of a reaction. As your insight will at once tell you, it will inhibit polymerization, abstract hydrogen from certain molecules, and be paramagnetic because of its unpaired electron.

*Eastman 7365 (at \$4.50 for 5 grams) is an example of some 3500 organic oddities and good, solid workhorses that can be ordered from Distillation Products Industries, Eastman Organic Chemicals Department, Rochester 3, N. Y. (Division of Eastman Kodak Company). They're in our List No. 40. Write for a copy.*

Prices quoted are subject to change without notice.

**This is one of a series of reports on the many products and services with which the Eastman Kodak Company and its divisions are . . . serving laboratories everywhere**

## PHILOSOPHICAL LIBRARY BOOKS

**INTRODUCTION TO ELECTRICAL APPLIED PHYSICS** by N. F. Astbury. A book on physics and engineering, reflecting the development of electrical science into a subject which is neither physics nor engineering, but a combination of both. Brings together the classical basis of the subject and specialist topics which are entering all fields of applied science. Numerous diagrams. \$10.00

**GALACTIC NEBULAE AND INTERSTELLAR SPACE** by Jean Dufay. The most complete account available of the many diverse phenomena, observational and theoretical, involved in the study of interstellar matter. Illustrated. \$15.00

**HIGH-SPEED SMALL CRAFT** by Peter du Cone. A well-known designer of high-speed marine craft discusses the factors governing problems of design and construction, including rudder design, use of reinforced plastics and light alloys, propelling machinery, and use of models for predicting behavior in rough water. 44 plates & 140 drawings. \$15.00

**ENGINEERING STRUCTURAL FAILURES** by Rolt Hammond. A survey of the causes and results of failures in over a century of engineering, including earthworks, dams, harbor works, buildings, bridges, and underground works; with special consideration to failures due to vibration, earthquake, subsidence, and in welded structures. \$12.00

**REASON AND CHANCE IN SCIENTIFIC DISCOVERY** by R. Taton. Dr. Taton examines the relative role of active purpose and chance in the processes of scientific discovery. Steering clear of theory, he illustrates his thesis by practical examples drawn from the lives and works of such distinguished scientists as Poincaré, De Broglie, Bernard, Galileo, Roentgen, Becquerel, the Curies, Leibniz, Newton and others. Illustrated. \$10.00

**CONSTRUCTING AN ASTRONOMICAL TELESCOPE** by G. Matthewson. A detailed guide book for the expert as well as the beginner. Second revised edition. Fully illustrated. \$3.75

**DICTIONARY OF MATHEMATICS** by C. H. McDowell. A concise definitive dictionary for students and the general reader. Many illustrated examples. \$2.75

**HISTORY OF MATHEMATICS** by Joseph E. Hofmann. In a wealth of detail Professor Hofmann explores the number systems and methods of ancient peoples, the role of the great translators of the Middle Ages, the problems and tensions of the Scholastic period. Numerous works of Renaissance and Early Baroque mathematicians are discussed, emphasizing developments which helped to pave the way for modern concepts. \$4.75

**ERNEST RUTHERFORD: ATOM PIONEER** by John Rowland. Lord Rutherford will be remembered most for his brilliant and revolutionary research into atomic physics, and as the result of his work, rapid progress was made towards the development of the atomic bomb, the building of power stations, and the utilizing of atomic energy for industrial purposes. Illustrated. \$4.75

**ELECTRONIC COMPUTERS** by T. E. Ivail. A non-mathematical introduction to the mechanism and application of computers employing valves and transistors. Both digital and analogue computers are covered, the bulk of the book being devoted to describing their circuitry, while their rapidly developing applications in industry, commerce and science are also outlined. In the final chapter, the future evolution of computers is discussed. 40 drawings and 25 photos. \$10.00

**ELECTRICITY AND MAGNETISM** by J. Newton. A detailed study of the phenomena and theory of electricity and magnetism. The author deals with current electricity, electrostatics, magnetic properties of materials, magnetometry and thermo-electricity, concluding with a survey system of units, electronic circuits and elementary atomic physics. The author is Senior Lecturer in Physics at Northampton Polytechnic, London. 4 plates, 261 figures. \$10.00

**SURGEONS ALL** by Harvey Graham. The thrilling story of a thousand and one surgeons, beginning in prehistoric times, continuing through the great civilizations of Egypt, China and India, Greece and Rome, and down through the Middle Ages to the present day. In this inspiring tale of man's ceaseless struggle with disease and death, body-snatchers rub shoulders with princes, mountebanks and witches jostle famous surgeons. The account of the rise, fall and renaissance of surgery ends with a forecast of the astonishing prospects for the future. Numerous illustrations. \$10.00

**CLASSICS OF BIOLOGY** by August Pi Suner. This Survey of the Study of Life, told by one of the foremost living biologists, illuminates the high-points of progress in this science by fascinating glimpses into philosophical theories throughout the ages until reaching our present-day observational methods. The author is a former President of the Academy of Medicine in Barcelona. \$7.50

**ORIENTAL MAGIC** by S. I. Shah. The first book in any language to correlate the magical tradition and techniques of the West with those of the Middle and Far East. The author is President of The Oriental Cultural League. Illustrated. \$7.50

## LETTERS

*The editors take no responsibility for the content of the letters published in this section. Anonymous letters will not be considered. Letters intended for publication should be typewritten double-spaced and submitted in duplicate. A letter writer should indicate clearly whether or not his letter is submitted for publication. For additional information, see Science 124, 249 (1956) and 125, 16 (4 Jan. 1957).*

### Passive Voice and Personal Pronouns

R. V. Ormes' judicious criticism of the passive voice [*Science* 125, 529 (1957)] reminded me, by contrast, of my own too sweeping indictment of it a year ago. A young chemistry major took my remarks seriously and wrote a formal account of experimental procedure entirely in the active voice, using the first personal pronoun. The result was revealing. At least it convinced me that the passive voice is sometimes preferable to the active, and that criticism of it should be confined, like Ormes', to its abuse.

To illustrate, here is a passage on procedure, chosen at random from the *Journal of the American Chemical Society*. The original reads: "The thick oil was dissolved in ether, the solution was extracted twice with dilute alkali, and the combined basic extracts were washed with ether. The ether solutions were combined, dried and evaporated to give 2.8 g. of starting alcohol. The basic solution was acidified with dilute sulfuric acid and extracted with ether. The ether layer was washed with water. . ."

Recast in the active voice, with the first personal pronoun, it reads: "We dissolved the thick oil in ether, extracted the solution twice with dilute alkali, and washed the combined basic extracts with ether. We combined the ether solutions, dried them, and evaporated them to give 2.8 g. of starting alcohol. We acidified the basic solution with dilute sulfuric acid and extracted it with ether. We washed the ether layer. . ."

Except for the opening sentence, the original version is superior, primarily because it places the emphasis where emphasis logically belongs: on the process rather than on the agent. Coherence is better too: in the original, the substance named at the end of one sentence tends naturally to become the subject or subject modifier at the beginning of the next ("... ether. The ether solution . . ."); in the revision, the reader is constantly brought back to "we" before he learns the next step in the on-going process.

But having stated the obverse or counterpart of Ormes' position with regard to the passive voice, I should like only to reinforce his position that the first personal pronoun is not an invariable sign of immodesty or subjectivity; sometimes considerations of objectivity

and responsibility, no less than of style, demand its use. Certainly avoidance of it is no guarantee of virtue; I recall one immodest self-reference that went something like this: "Analysis of this problem is difficult, but after long deliberation, it was decided by this analyst to. . ." Even worse is the pretense that beliefs are held and assumptions are made without danger of contamination from human fallibility. "It is assumed" may be quite all right for reminding a reader of assumptions customarily understood when certain equations are used, but the reader should know when the assumptions are original, and the simplest way to tell him is by saying "I have assumed. . ."

After all, human agents are responsible for designing experiments, and they are present in the laboratory; writing awkward phrases to avoid admitting their responsibility and their presence is an odd way of being objective. P. W. Bridgman (*Reflections of a Physicist*, 1950, pp. 57-58) puts it even more strongly: "In suppressing these personal expressions I am doing an unnatural thing that sometimes demands obvious circumlocutions and always involves an element of convention and construction. If I want to express what obviously occurs, I have got to use the first person. Has it ever been adequately proved, or has ever the assumption been adequately examined that in forcing myself to speak non-personally I have not thrown away something vital?"

JANE J. ROBINSON

University of California, Los Angeles

### University Responsibilities and Government Money

I agree very definitely with Paul Klopsteg [*Science* 124, 919 (1956)] that the danger of government sponsorship of research is that of violation of the integrity of the universities in their research programs. However, the proposals and the suggestions made by Klopsteg are, in my opinion, diametrically opposite to those which would solve the problem.

In principle, Klopsteg proposes that whenever funds are granted to an institution for a particular project by a government agency, these funds should cover only part of the costs, and the remainder of the costs should be supported from the university's research funds, thus fulfilling the obligation of the university to support research. That this method of operation would lead toward the domination of the over-all research activity of an institution by granting agencies can be made clear by the following example.

Let us assume that a given institution has a total of \$100,000 (including overhead) to distribute among its various research activities. In the absence of a granting agency, the institution can

**POLARAD**

## AUTOMATIC RECORDING TITRATOR

for simultaneous measurements and recording of variable and constant pH factors

Allows automatic techniques to be applied to unknown compounds, to rapidly and accurately determine:

- A. Ionization constants, from which are determined minimum equivalent weights, purity, and structural features.
- B. Kinetic analysis of reactions.

### FEATURES:

- Speeds analysis • Provides permanent record • Automatic cut-off when reagent is exhausted permits unattended operation for round-the-clock measurements of slow reactions. A port in the cell permits addition of reagents during operation • Choice of micrometer, microburet or micrometer syringe, quick substitution for rapid titrant changes • Accuracy of 0.02 pH units • Complete titration curves can be obtained within two minutes • Typical 10 cubic centimeters sample volume capacity (other capacities available to suit specific needs) • Cell temperature can be regulated by controlled water bath (optional) • Magnetic stirrer provided • Range switch, which varies the ratio of titrator travel to recorder pen movement, ensuring complete on-paper plot without changing reagent concentration after a reaction has started

## 1957 Model Heavy Duty GYROTORY® SHAKER

A dependable, maintenance-free Rotary Action Shaker for general laboratory work when thorough shaking and vigorous agitation for sustained periods of time are required.

140 to 400 oscillations per minute (alternate speed range—50 to 150)

1" eccentric rotary motion

two platform sizes—18" x 30"—24" x 36"

interchangeable platforms

Featuring a newly developed three-eccentric-shaft drive and stabilizing design, the Model G10 distributes a positive, uniform, rotary motion to all parts of the shaking platform without any swaying or sagging at the edges of the table even under unbalanced loading conditions.

Platforms hold Erlenmeyer flasks, test tubes or other glassware.

## ANATOMICALLY ACCURATE (SYNTHETIC) MINIATURE HUMAN SKELETON

No. ZK500

*Superbly Adapted For Elementary Work  
Where Economy Is Important*

*Only 26 Inches Tall*

Accurately Scaled  
In Durable, Washable  
Synthetic Bone

A Wooden Case  
And Plastic Cover  
Are Included

Designed for use in high school biology courses, the miniature skeleton has proved of value in psychology, health, safety, first aid, and physical education courses. The low price enables the smaller schools to have at least one skeleton in the science department. The skeleton, with wooden case, weighs less than 20 pounds making it easy to carry from room to room.

The wooden case is constructed to permit the rotation of the skeleton within the case. An illustrated key card on the door identifies the principal bones. This arrangement permits a student to study the guide and skeleton together in order to more easily understand the skeleton. If desired, the skeleton can be removed from the case and hung in a more convenient place. The hook on the skull provides for attachment to other types of support.

Each skeleton includes an attractive wooden case, plastic skeleton cover, and an illustrated key card.

**ZK500. MINIATURE SKELETON, Painted.** The muscular origins are painted in blue, and the muscular insertions are in red on one side of the skeleton. Complete, with wooden case, plastic skeleton cover, and 2 illustrated key cards. Each, \$137.00

**ZK510. MINIATURE SKELETON.** The skeleton is the same as ZK500, but the muscular origins and insertions are not painted. Many teachers prefer to paint the muscular insertions and origins themselves, and the surfaces of these skeletons readily accept paint. Complete with attractive wooden case, illustrated key card, and plastic cover. Each, \$115.00

Full, Life-Size Skeleton  
available at \$188.00.

choose, using its best judgment for the benefit of mankind, which individuals and research programs it will support with this fund. We must further assume, which is generally true, that the institution would like to enlarge its research activities. This desire is certainly in line with the aims of Congress as specified in the formation of the National Science Foundation. To simplify our thinking, let us assume that the granting agency agrees to spend \$5000 for 20 specific projects which it approves, provided that a corresponding and equal amount of money toward each of these projects is granted by the institution. Thus, the institution can double its research activity and spend \$200,000 on research, provided that it undertakes projects approvable by the agency. On accepting the aid of the granting agency under this procedure, the institution becomes the servant of the granting organization, which effectively controls the whole research program at the university. Under the alternative system, the granting agency would support the total costs of ten specific projects at \$10,000 each which are approved by the granting agency. At the same time, the institution will retain its integrity with respect to the expenditure of the \$100,000 which it originally had, and it may now devote this money to any ten research projects which it feels, or its scholars feel, are best, regardless of the views of the granting agency. Thus the institution is no longer the complete slave of the granting agency.

Another insidious method of using the institution's funds in the support of research approvable by a granting agency is that of requiring that the principal investigator, who devotes a material part of his effort to the work supported by the grant, shall do so without charging his time to the grant, thus forcing the institution to carry his salary and its share of the overhead. In many cases, especially in the case of small grants, this cost is as large as, or larger than, the grant itself.

A further loss of control by the institution of the direction in which its own funds may be used through the procedure suggested by Klopsteg is brought about in a more subtle manner. Whenever a sponsoring agency fails to provide the full indirect costs of a project by limiting the allowance for them to 15 percent of direct costs or to some other arbitrary figure that is less than the true cost, the institution is forced to use a portion of its free funds to make up the difference. This must of necessity be true, since overhead rates are determined by distributing actual indirect costs over all programs, whether or not the overhead costs are provided by the granting agency. Since this indirect contribution to an added project through the failure to ob-

tain full overhead may be obscure, institutions are prone to accept the grant without qualm. However, when the number of projects reaches a significant size over several years, the total value of general funds used in this manner becomes an important drain on general funds that might otherwise be used for university-sponsored research, faculty salaries, or other activities traditionally associated with the institution. Klopsteg's implication that overhead funds are "uncommitted money" would appear to indicate his failure to understand the concept of indirect costs. Expenses for which overhead allowances are made must be paid by the institution. If the overhead allowances themselves are identified as "uncommitted money," then other available "uncommitted money" must be used to pay for the overhead expenses. There can be no net gain in "uncommitted money" from overhead allowances in the long run, for administrative costs must be paid, research buildings and equipment must be maintained and replaced, and the library facilities must be available for research workers. It is these costs that an overhead allowance is designed to cover. It does not increase the volume of free funds in an institution.

CARL C. CHAMBERS  
University of Pennsylvania, Philadelphia

My purpose in publishing the article to which Carl Chambers refers, and the one in the next following issue of *Science*, has been accomplished when thoughtful, judicious persons like Chambers are moved to comment on the problems discussed. Whether our views coincide or differ matters little. What is important is recognition of the problems, and action to solve them.

It is quite impossible within the scope of a letter and a response to reconcile all the divergent views, nor does it seem possible at all, for we are dealing with opinions based on appraisal and judgment of facts and assumptions. What I shall attempt to do is to clarify where it appears that Chambers misunderstood what I tried to convey.

One such instance appears in his second paragraph in which he makes a condensed and, I regret, an erroneous paraphrase of what I "propose in principle." I do not propose that "whenever funds are granted to an institution . . . by a government agency, these funds should cover only part of the costs." On the contrary, in those research areas in which by far the greatest volume of government money flows to the institutions, I have stated that all costs, direct and indirect, should be *adequately* covered. These areas are comparatively new in the research pattern at universities, having come into being under OSRD during World War II. Most of the work is applied, not basic.

Dilution Methods

The Cahn Electrobalance is an entirely new concept in micro weighing. It's as portable as a typewriter and as easy to set up and operate.

It is unaffected by vibration, variable temperature, air currents or even by leveling.

Sample is weighed by balancing against an electromagnetic torque which is electrically controlled with high precision. Weighing chamber may be removed and operated by remote control.

#### SWITCH SELECTS ANY ONE OF THESE FOUR RANGES:

Range	Sensitivity	Accuracy
0-5 mg.	1 microgram	2.5 micrograms
0-10 mg.	2 micrograms	5.0 micrograms
0-20 mg.	5 micrograms	12.0 micrograms
0-50 mg.	8 micrograms	30.0 micrograms
Precision 0.02%		Accuracy: About 0.05% of full scale.

## **MICROMANIPULATOR "CAILLOUX"**

Unmatched flexibility of movements in all directions in space are achieved by natural hand movements under magnifications of 100 X to 2000 X without adjustment. The "Caillox" advanced design combines maximum speed, precise response and stability with unusual ease of operation. Back-lash, parasitic vibrations and lag are eliminated. Prolonged manipulations can be conducted without fatigue. Includes many additional exclusive features.

The much smaller segment of research, aided by government, in which I strongly feel that institutions must maintain complete independence and integrity, is that which by tradition is the admitted responsibility of the university. To preserve the essential freedom, it is necessary that institutions receive financial aid from many sources, so that they may support competent scholars on their faculties in their intellectual pursuits, with complete absence of extraneous intervention, domination, or control. Money from private individuals and foundations assures such freedom. Money from government does not, since this is public money over which surveillance must be exercised in the public interest. If an institution, viewing a source of government funds as a virtually inexhaustible reservoir, insists that a grant or gift from such a source to help it in supporting scholarly research must cover fully every kind of outlay, direct and indirect, such insistence increases the danger of government control. This follows, because such discussions about overhead bring into the argument fiscal questions by participants who lack understanding of the ideals and functions of the university.

In dealing with private sources of gifts, the point is seldom made by universities that such sources must accompany their grants by an additional 25 to 50 percent of the principal amount tendered to cover indirect costs. Generally, private gifts are happily accepted as tendered, and great good will continues between the institution and the donor. If private sources could be stimulated to provide sufficient funds to enable universities and colleges to carry on their important functions, as is discussed in my second article, the question of overhead on gifts would fade away. To my knowledge, it never arose before government money came into the picture.

For a number of years, I have been in position to observe "from the inside" the increasing support of research through government funds. There is nothing insidious or sinister in the management of these funds by any agency. Those responsible for allocation and disbursement are honest, devoted public servants. Their duty to the taxpayer requires that they exercise judicious "control"; that is, they are responsible for seeing that funds under their supervision are handled properly under applicable statutes and the rules and regulations that have been derived from them. Because I feel so keenly the need for preserving freedom of action for the institutions, both intellectually and administratively, I feel growing apprehension over the fact that, as financial support from a given source increases, so also does the amount of control from that source increase.

If what I have written here and in my articles on these questions conveyed the

impression that I fail to understand the concept of indirect costs, it is only because I failed to express myself clearly. During my many years as a business executive, I have had long, practical experience with that subject. Indeed, the problem of overhead is a perennial subject of discussion, if not controversy, among cost accountants. In its practical applications, it must in some of its aspects be handled arbitrarily. Probably it can never be settled to the satisfaction of everyone concerned with it. The use of the term *true cost* by Chambers implies a concept that is practically attainable. A method of determining the true cost

of the contemplated basic research of a faculty scholar would be a major contribution to the art of accounting.

I respect Chambers and his views highly. I hope that it is not impertinent for me to say that the views are not unfamiliar to me, for I have heard them expressed in many discussions with university administrators. If he and I could discuss them in person, which I hope we may do, I am sure that we could substantially reduce our differences concerning the important questions under scrutiny here.

PAUL E. KLOPSTEG

Glenview, Illinois

## THE "BRONWILL"\* Warburg

### most compact-most versatile

### Warburg Available

Model UV shown above, is a compact, circular unit, only 20½" diameter, 31" high, rotatable thru 320° permitting any of the manometers to be quickly read. Model UVL equipped for photo-chemical work.

### Requires only 20½" of Desk Space

- Magnetic Temperature Setting.
- Highest Temperature Constancy  $\pm 0.01^\circ \text{C}$ .
- Cooling Coil Built In.
- Fastest to Set Up. Small bath (only 8 liters) heats from ambient to  $37^\circ \text{C}$  in 22 minutes.
- Rotatable thru  $320^\circ$ .
- Calibrated—Interchangeable Manometers & Vessels Available.
- Available for Photosynthesis.

EASY TO READ

### DOUBLE CAPILLARY MANOMETERS

Single background scale—a sturdy single rod containing two capillaries. Available pre-calibrated—interchangeable—no more calibrating each time a piece is broken.

## OPTICAL BARGAINS

Fine, American-Made Instrument at  
Over 50% Saving

### STEREO MICROSCOPE

Up to 3" Working Distance—  
Erect Image—Wide 3 Dimensional Field

Now, ready after years in development—this instrument answers the long standing need for a sturdy, efficient STEREO MICROSCOPE at low cost. Used in production—in research—in the lab, shop, factory, or at home; for inspections, examinations, counting, checking, assembling, dissecting—speeding up and improving quality control. 2 sets of objectives on rotating turret. Standard pair of wide field 10X Kellner Eyepieces give you 23 power and 40 power. Additional eyepieces available for greater or lesser magnification. A low reflection coated prism erecting system gives you an erect image—correct as to right and left—clear and sharp. Helical rack and pinion focusing. Precision, American-made! Storage chest included. 10-DAY TRIAL... complete satisfaction or your money back.

Order Stock No. 85,039-W (Shipping wt. approx. 11 lbs.)  
Full price ..... \$99.50 f.o.b. Barrington, N. J.  
Send Check or M.O.

### See the Stars, Moon, Planets Close Up! 3" "PALOMAR, JR." TELESCOPE 60 and 120 Power — An Unusual Buy!

Assembled—ready to use! You'll see the Rings of Saturn, the fascinating planet Mars, huge craters on the Moon, Star Clusters, Moons of Jupiter in detail. Galaxies! Aluminized and overcoated 3" diameter high-speed f/10 ventilated mirror. Equatorial mount with lock on both axes. An Optical Finder Telescope, always so essential, is also included. Sturdy, hardwood, portable tripod. Order by Stock No. — Send check or M.O. — Money-back guarantee!

Stock No. 85,050-W (Shipping wt. 10 lbs.)  
\$29.50 f.o.b. Barrington, N. J.

### MEASURING POCKET MICROSCOPE — 50 POWER

No larger than an ordinary fountain pen, this handy pocket instrument is ideal for making direct reading measurements; for checking small parts and dimensions under powerful magnification. Speeds up quality control. Instrument contains a precision, glass etched reticle calibrated for measurements up to 1/10" by .001" divisions. Estimates to .0005" can easily be made. Chrome reflector at base of instrument reflects light on object examined or measured. Sturdy construction assures long, useful service.

Stock No. 30,225-W ..... \$7.95 Postpaid

### BUILD A SOLAR ENERGY FURNACE

A fascinating new field. You can build your own Solar Furnace for experimentation—many practical uses. It's easy—inexpensive. We furnish instruction sheet. This sun powered furnace will generate terrific heat—produces many unusual fusing effects. Sets paper aflame in seconds. Use our Fresnel Lens—14 1/4" diameter . . . f.l. 14".

Stock No. 70,130-W package of 1 .. \$6.00 Postpaid  
Stock No. 70,131-W package of 2 .. 11.00 Postpaid  
Stock No. 70,132-W package of 4 .. 20.00 Postpaid

## EQUIPMENT NEWS

*The information reported here is obtained from manufacturers and from other sources considered to be reliable. Science does not assume responsibility for the accuracy of the information. All inquiries concerning items listed should be addressed to Science, Room 740, 11 W. 42 St., New York 36, N.Y. Include the name(s) of the manufacturer(s) and the department number(s).*

■ **PULSE GENERATOR** provides repetition rates up to 100,000 pulses/sec as well as a manual trigger for single pulses. Maximum rise and fall times are 0.018 sec. Pulse width is continuously adjustable between 0.05 and 100 sec. Maximum pulse amplitude of either polarity is 50 v into 50 ohm. Attenuation of 59.5 db in 0.5 db steps produces no pulse degradation. Hard-tube circuitry is used throughout. (Allen B. DuMont Laboratories, Inc., Dept. S313)

■ **SURVEY METER** is available either as a beta counter with a 3 to 4 mg/cm<sup>2</sup> end window or as an alpha-beta-soft x-ray counter with a 1.4 to 2 mg/cm<sup>2</sup> window. Maximum counting rate is 50,000 count/min or 20 mr/hr. A radioactive sample is built in for calibration. (Nuclear Measurements Corp., Dept. S329)

■ **OIL-BATH THERMOSTAT** for the temperature range from ambient to 260°C is stirred by the magnetically actuated up-and-down motion of a base plate. This mode of operation is said to provide the advantages of greater work space and uniform distribution. Control sensitivity is 0.25°C. Three standard sizes are available, wired for either 115 or 230 v. (Blue M Electric Co., Dept. S342)

■ **TUBE FURNACE** is capable of heating to 5000°F in approximately 2 hr. The heat zone is 12 in. long and 3 in. in diameter. Carbon resistors are the heating elements; electrodes are water cooled. Electric interlocks shut down the furnace automatically on failure of the water supply. The furnace may be equipped with either Ignitron-Thyratron-type or saturable-reactor-type power control. (Wheeler-Knight and Gailey Inc., Dept. S346)

■ **POWER SUPPLY** furnishes all the power required to operate the Beckman model DU spectrophotometer, eliminating the need for storage battery and dry-cells. Power for ultraviolet accessories is also provided. According to the manufacturer, the new power supply improves the over-all operating stability of the spectrophotometer. Dimensions are 6 1/2 by 11 by 22 in. Weight is 35 lb. Input power is 50 to 60 cy/sec, 115 v, 350 w. (Beckman Instruments Inc., Dept. S347)

■ **LIQUID LEVEL CONTROL** is of explosion-proof design. The detector is capacitance actuated, converting changes in level to directly or inversely proportional pneumatic output. Probes are rigid, rod-shaped structures having no moving parts. (Robertshaw-Fulton Controls Co., Dept. S343)

■ **BLOOD-GROUPING REAGENT**, called Anti-A<sub>1</sub> Lectin, is said to produce more rapid and clear-cut agglutination of A<sub>1</sub> and A<sub>1</sub>B specimens of human blood. The reagent is extracted from the seed of an Indian legume, *Dolichos biflorus* and purified by fractionation; it is available in 2-cm<sup>3</sup> dropper vials. (Hyland Laboratories, Dept. S349)

■ **ELECTRONIC SWITCH** controls up to 500 watts of power, either delivered at 115 v, 60 cy/sec, or switched by its internal contacts. Minimum input impedance is 2 Mohm. The switch may be actuated by a contact closure. A rear-mounted terminal strip provides access for selection of switching functions. Autron Engineering Inc., Dept. S336)

■ **REMOTE POSITIONING DEVICE** is based on 360-deg potentiometers with taps 90 deg apart. A receiver and transmitter potentiometer are used in a self-balancing bridge network. Imbalance of the system produces error signals that actuate a direct current motor, through a relay, to adjust the receiving potentiometer to balance. The maximum follow-up rate of the receiver is 60 deg/sec. Accuracy is said to be ±0.5 deg. (Air Marine Motors, Inc., Dept. S341)

■ **RATIO PLOTTER** accepts two alternating voltages produced by transducers and plots their ratio continuously on a strip-chart recorder. The input voltages are fed into identical amplifiers and rectifiers in separate channels. A range of four full-scale settings permits plotting of ratios from 0 to 0.2, 0 to 1, 0 to 10, and 0 to 100. Frequency response is ±2 percent from 5 to 2000 cy/sec and ±2.5 percent from 2 to 4 kcy/sec. Chart speed is variable from 6 to 960 in./hr. (Barry Controls Inc., Dept. S337)

■ **OXYGEN INDICATOR** measures as little as 2 ppm of oxygen in hydrogen or inert gases in the presence of up to 3 percent CO. The gas being tested is passed over a catalyst which causes any oxygen present to combine with hydrogen and detects the heat evolved. Hydrogen is generated, if necessary, by an electrolytic cell built into the indicator. The electric signal provided by the thermopile used to detect the rise in temperature is indicated and recorded by a potentiometer. (Baker and Co., Dept. S344)

JOSHUA STERN  
National Bureau of Standards

*Slowing down the leucocytes*

*Magnification of blood sample from leukemia victim, showing extreme white cell-to-red cell imbalance. White cell level 250 times greater than normal.*

## Beckman® DK Automatic Recording Spectrophotometer speeds research in leukemia

Seeking to stop leukemia, medical scientists have learned how to slow it down. Inhibitors have been found that temporarily stop the abnormal production of *leucocytes*, white blood cells. But, because the body develops resistance to these present inhibitors, white cell metabolism must be better understood and more selective inhibitors discovered to permanently stop abnormal production of leucocytes.

Leucocyte-inhibitor reaction is studied by introducing a radioactive assimilate into the environment of leucocyte samples, both in the presence and in the absence of an inhibitor. To determine what metabolic use the leucocytes make of the radioactive substance and what effect the inhibitor has on this process is a big analytical job.

### Beckman DK-2 gets the job done twenty times faster

A typical experiment of this type involves the collection of 1,000 fractions, measuring each fraction on a spectrophotometer for ultraviolet absorption, and plotting results – an almost insurmountable task without a high-speed automatic instrument. The medical researchers faced with making these thousands of analyses have found that the Beckman DK-2 Automatic Recording Spectrophotometer is 20 times faster than manual measurement and recording.

Whenever analysis in ultraviolet, visible, or near-infrared ranges is required, the speed and precision of the Beckman DK-2 can accelerate research significantly. For details, see your Beckman dealer, or request Data File 2L-27-38.
