## EQUIPMENT NEWS

*The information reported here is obtained from manufacturers and from other sources considered to be reliable. Science does not assume responsibility for the accuracy of the information. All inquiries concerning items listed should be addressed to Science, Room 740, 11 W. 42 St., New York 36, N.Y. Include the name(s) of the manufacturer(s) and the department number(s).*

■ **FREQUENCY CONVERTER** furnishes 75 w of 1200- or 2400-cy/sec power. Input power is 95 w at 400 cy/sec, three-phase. Frequency multiplication of the 400-cy input provides synchronization of the output wave. The device is transistorized for compactness and lightness. Weight is 2.5 lb. Regulation is 3 percent from no load to full load. Rise time is 5  $\mu$ sec. (Robertshaw-Fulton Controls Co., Dept. S818)

■ **INTEGRATOR** for gas and vapor-phase chromatography is available as part of original equipment or for use with a separate recorder. Integration is performed electrically. Indication is made by means of pen strokes at the margin of the chart. Three line lengths indicate units, tens, and hundreds. At full-scale deflection, 40 lines are recorded per second. (Burrell Corporation, Dept. S826)

■ **AMPLIFIER SYSTEM** is a seven-channel a-c voltage preamplifier for piezoelectric transducers. Voltage gains are 1.0 and 10.0. Input impedance is 100 megohm with bandwidth 0.4 to 200,000 cy/sec. Each channel has its own isolated power supply. (Dynamics Instrumentation Co., Dept. S833)

■ **FLOW SWITCH** will detect flows in the range from  $\frac{1}{4}$  to  $\frac{1}{2}$  gal/min and provide circuit closure for indication or control. The transducer will operate in any attitude. Normal temperature operating range is  $-85^{\circ}$  to  $+550^{\circ}$ F. Reverse flow can also be detected. The instrument is supplied in aluminum, stainless steel, bronze, nickel, Monel, Inconel, or other metals. (Potter Aeronautical Corp., Dept. S839)

■ **WATER DETECTOR** for crude oil can be used also to detect and control other constituents which affect the dielectric constant of a process material. The fixed dielectric-constant capacitor probe is sensitive to variations of 0.1 percent. Water content is indicated by pilot lights, and signals are transmitted to a control unit which actuates valves to re-route contaminated material. Time delays may be set so that momentary variations are ignored. (Instruments, Inc., Dept. S830)

■ **IONIZATION GAGE** of the Bayard-Alpert type is linear through a range from  $5 \times 10^{-4}$  to  $10^{-12}$  mm-Hg. A double filament is used for long tube life, and the grid can be outgassed by electron bombardment. The collector, a single wire enclosed in a spiral grid, is small enough to be outgassed by radiant heat. The Nonex-glass envelope has a half-inch-diameter tubulation provided with a graded Nonex-to-Pyrex seal. (Consolidated Electrodynamics Corp., Dept. S832)

■ **KERR-CELL SHUTTER**, designed to be mounted on a camera, has an aperture 1.25 by 2.0 in. Speeds are as great as 0.1  $\mu$ sec, and triggering can be synchronized to within 2  $\mu$ sec. Electronic controls are contained in a modulator unit which can be remotely located and connected by flexible leads. The triggering pulse can be as low as 50 v. (Electro-Optical Instruments, Inc., Dept. S829)

■ **RANDOM-SIGNAL VOLTMETER** provides root-mean-square measurements of random voltage signals. Accurate long-time-average measurements are made in the presence of low-frequency components. A panel switch selects a 0.1-sec integration time for quick estimates or a 10-sec interval for exact measurement. Accuracy is  $\pm 2$  percent on 18 full-scale ranges from 500  $\mu$ v to 250 kv r.m.s. Bandwidth is 2 to 250,000 cy/sec within  $\pm 0.2$  db. (Flow Corporation, Dept. S836)

■ **ACTIVATED CARBON** is available in molded shapes formed from powdered, highly adsorbent carbon bonded with an organic resin. The shapes are treated to be dust free. Two sizes of wafers are presently standard; one 3 mm thick by 33 mm in diameter, the other 9 by 38 mm. (National Carbon Company, Dept. S831)

■ **VIBRATOR** employs a hydraulic-mechanical system to produce forces up to 20,000 lb at frequencies up to 600 cy/sec. Acceleration levels up to 50 g are reached. The vibrator consists of a vibration head, a hydraulic pump unit, and a variable-speed-drive motor. The force piston is designed to carry loads up to 100 lb directly. Larger loads are independently suspended. (L. A. Corporation, Dept. S843)

■ **TIME-CODE GENERATOR** supplies a 16-bit, 24-hour binary code to hours, minutes, and seconds. Time can be read directly to 0.01 sec and interpolated to 0.001 sec. In addition to binary codes, continuous pulse trains of 100, 10, and 5 pulses/sec are produced. The time source is a temperature-controlled crystal with long-term accuracy of 1 in  $10^6$ . Coding is done by transistor-driven magnetic cores.

The unit will operate over a temperature  
range -40° to +80°C. (Electronic Engi-  
neering Co. of California, Dept. S841)

■ **SCINTILLATION TRANSDUCER** combines  
a high-clarity, thallium-activated so-  
dium-iodide crystal with a standard  
5-in. multiplier phototube in an inte-  
gral unit. The units are housed in mu-  
metal magnetic shields together with  
preamplifiers. Crystal length up to 4 in.  
is available, and special configurations  
can be supplied. (Levinthal Electronics  
Products, Inc., Dept. S834)

■ **HIGH-VOLTAGE POWER SUPPLY** for scin-  
tillation counters uses a bank of 17 cold-  
cathode tubes to regulate the output  
voltage. Drift over a 6-day period is less  
than 1/1000. Output voltage is variable  
in 17 steps from 100 to 1400 v; output  
current is 1 ma. Load regulation is 0.35  
percent, and line regulation is 0.01 per-  
cent from 100 to 130 v. (Victoreen In-  
strument Co., Dept. S804)

■ **INFRARED ANALYZER**, for gases of med-  
ical interest, uses detector cells sensitive  
to the gas to be measured. Cells can be  
interchanged to permit measurement of  
carbon dioxide, nitrous oxide, cyclopro-  
pane, Fluothane, and other gases. Ap-  
plication to anesthesia monitoring is sug-  
gested. (Spinco Division, Beckman In-  
struments, Inc., Dept. S835)

■ **VARIABLE-FREQUENCY OSCILLATOR** has a  
continuously adjustable range of 100 cy  
to 100 kcy/sec. Output frequency is se-  
lected by positioning five digital selector  
switches. Accuracy is  $\pm 0.005$  percent or  
 $\pm 5$  counts, whichever is greater. A crys-  
tal-controlled generator is used as a re-  
ference-signal source. (Digital Instru-  
ment Laboratories, Dept. S838)

■ **VOLATIMETER** is an instrument for de-  
termining the moisture content of solids.  
Water vapor volatilized from the par-  
ticles of the specimen just below the  
melting point is trapped in a syringe of  
the apparatus. Rise of the syringe piston  
measures the volume of vapor thus col-  
lected. (Manufacturers Engineering and  
Equipment Corporation, Dept. S842)

■ **ELECTROMAGNETIC ANGLE TRANSDUCER**,  
developed by Bell Telephone Labo-  
ratories under Air Force contract, exhibits  
resolution better than  $\pm 3$  sec of arc. The  
instrument is a reluctance-type, variable-  
coupling transformer. Two output volt-  
ages vary in amplitude as the sine and  
cosine of 27 times the angle through  
which the rotor is turned. Other ratios  
are possible. All windings are on the  
stator, leaving the rotor free of sliding  
contacts. (Clifton Precision Products  
Co., Dept. S846)

The NEW AO-Baker Interference Microscope is the unique combination of a double beam interferometer and polarizing microscope. It dramatically provides for the precise examination of transparent specimens where detail is exhibited by variations in thickness or refractive index.

With white light illumination, contrast effects are greatly enhanced by brilliant and *variable color contrasts*. Details show up as if differentially stained.

With monochromatic or filtered light, interference contrasts can be varied from bright to dark and relative optical thicknesses are measurable to an optimum accuracy of  $1/300$  wave length.

Interference Contrast Microscopy like Phase Contrast Microscopy depends on the nature of the specimen detail to retard light—by virtue of refractive index and thickness—and does not depend on the property of the specimen to absorb light. In this connection the AO-Baker Interference Microscope is similar to the conventional Phase Contrast Microscope.

The principle of the Phase Contrast Microscope depends upon light diffraction for its contrast effects—the AO-Baker Interference Microscope does not. By means of the unique built-in interferometer, mutually interfering beams are produced, recombined, and if the two beams suffer relative retardation, readily visible contrast results.

The AO-Baker Interference Microscope has already won acclaim and recognition as an important aid to the solution of a great variety of biological and industrial microscopical problems. Most scientific workers were *initially* of the opinion that the Interference Microscope would have its greatest utility for solving measurement problems. It now develops that equal or greater promise can be expected from its value as a method of variable phase and variable color contrast.
