

ONE FOOT HIGH EXACT SKELETON MODEL

After four years' work, an amazing, precise, one foot high model of the human skeleton, at a price within reach of every science student, every classroom. Thousands already bought by schools, doctors, hospitals, hobbyists. Instructive, intriguing. Magnificent conversation piece or museum curio. Ideal subject for photography. A thing of beauty, a triumph of model-making. Medical schools, doctors, scientists praise its elegant detail. No longer necessary to pay \$90.00 or more for skeleton models. Original model took two years to make, two years more getting into production, to achieve exacting accuracy. Complete with instructive diagram. Easy to assemble. Handsome box has embossed nest for each part. Lifetime durability, made of remarkable bone-color material. Can be bent, dropped, struck without breaking. Postpaid in U.S. No C.O.D.'s.

Only **\$10.00** each **Money Back Guarantee**

ANDREW TECHNICAL CO.

RECORD YOUR OBSERVATIONS with a UNITRON PHOTOMICROGRAPHY SET!

An inexpensive accessory that duplicates the performance of costly apparatus. For every type of microscopy and photography. Easy to operate. Allows continuous observation while camera is in place, even during time exposures. Adjustable to fit the camera of your choice (35mm., #120, #127, motion picture, etc.). A valuable aid for teaching or learning.

FREE 10-DAY
TRIAL

LETTERS

The editors take no responsibility for the content of the letters published in this section. Anonymous letters will not be considered. Letters intended for publication should be typewritten double-spaced and submitted in duplicate. A letter writer should indicate clearly whether or not his letter is submitted for publication. For additional information, see *Science* 124, 249 (1956) and 125, 16 (4 Jan. 1957).

Symbols to Indicate Castration

Symbols and abbreviations are used by most scientists and researchers when recording or describing the result of some observation or experiment.

Symbols denoting the sexes of animals (♂ ♀) have been used for many many years. There is nothing about these symbols, however, to indicate whether the animal is sexually intact and in possession of its gonads or whether it is a castrate. The importance of indicating the difference may be very great at times.

It is proposed that the circle part of the symbol be opened in the case of castrates to form the letter C. The arrow and cross-piece characteristic of the male and female, respectively, would have their regular position on the circle.

"Weaver Finch"

Mayr, Linsley, and Usinger [*Methods and Principles of Systematic Zoology* (1953), p. 17] state: "Even the experimental biologist has learned to appreciate the necessity for sound, solid identification. There are great numbers of genera with two, three, or more very similar species. Such species very often differ more conspicuously in their physiological traits than in their morphological characters."

This statement seems so obvious to most taxonomists as to make its repetition verge on the flogging of a dead horse. Hence it was all the more surprising and disappointing to find the paper by S. J. Segal in the December 13 issue of *Science* [126, 1242 (1957)] describing certain hormonal experiments on "the weaver finch." Taxonomists have more or less resigned themselves to seeing generalizations in the literature of such disciplines as physiology, endocrinology, and embryology about the duck, the goose, the pigeon, the rat, or the rabbit; it can be reasonably assumed that the experimental animal in such cases is the common domesticated species (although I believe it should be explicitly so stated). However, "the weaver finch" is completely meaningless. "Weaver finch" is a general

Significant Advance in Film Badge Dosimetry by

gives you all these
special features in

MEASUREMENT...

Extreme sensitivity — 5 mr for soft x and gamma rays; 10 mr for hard x and gamma rays

Wide exposure range — from 5/10 mr to 600R

Complete coverage—beta-gamma, x-ray, and neutron film packets are held in one badge

DESIGN...

Tamper-proof — special unlocking device required to open badge

Combined film and security badge — has space for standard 1½ × 2 identification photo

Lightweight — sturdy, moulded plastic badge weighs less than 1 oz.

SERVICE...

Prompt weekly reports, supplemented by quarterly and annual cumulative report

For data on the newest advances in film-badge dosimetry write for Bulletin S-3

term applied to many of the members of a very large bird family, Ploceidae, which may even be of polyphyletic origin. No more precise name than "weaver finch" is given, either in English or in Latin, in Segal's paper. It might be argued that reference can be made to earlier papers cited; this is true, although it should not be necessary. Checking one of Segal's cited references, that to Witschi's paper in *The Wilson Bulletin*, I find no less than four species of the family Ploceidae mentioned: the English sparrow (*Passer domesticus*), the paradise whydah (*Steganura paradisaea*), the red-billed weaver (*Quelea quelea*), and the orange weaver (*Euplectes orix*). Scientific names are given by Witschi for the last two only. The brief description given by Segal of his experimental birds ("the male bird assumes a bright yellow and black plumage . . .") fits none of the species mentioned by Witschi; the *Euplectes*, which comes closest, is described by Witschi as "black and orange red."

Segal's experimental bird is not identifiable from his description as published. In any case, it is almost certainly a member of a genus of the sort mentioned in the quotation from Mayr, Linsley, and Usinger, "with two, three, or more very similar species"—there are many such genera in the Ploceidae. The normal cycle of molts and plumages in wild birds may vary, even among closely related species, to the extent that it should be considered of fundamental importance to establish the identity of the experimental birds.

One further point. Segal mentions his "weaver finch" as being "readily available in the United States because large numbers are imported for sale to bird fanciers." Having had experience in recent years for the identification for zoos and aviaries of birds sold by importers, I would consider such birds to be extremely unreliable as standardized experimental animals. Birds of several genera are sold under the general term "weaver birds." A dealer may supply two shipments of what he honestly believes to be the same species to the experimenter; unfortunately, neither may be capable of recognizing the differences between closely-related species in a genus such as *Ploceus*, one of the largest genera of weavers; the consecutive shipments may well involve more than one species. Even within a single species the possibility arises of geographic variation in physiological characteristics, a well-known phenomenon in certain groups of birds and other animals. Very few importers of cage birds have any notion as to the precise area of Africa from which their weaver birds may be derived.

In the absence of an established breeding stock of experimental animals such as is now available for the golden ham-

ster or the budgerigar, it would appear to be of critical importance for nontaxonomic zoologists to secure authoritative taxonomic identifications of their subjects before publication of their results.

KENNETH C. PARKES

Carnegie Museum,
Pittsburgh, Pennsylvania

I shall humbly agree that, in my description of "the weaver finch," it might have been pointed out more clearly that the so-called "yellow weaver" or "Napoleon weaver" (*Euplectes afra*) is the species that serves in the establishment of the standard of the discussed hormonal reaction.

In all other respects the criticisms of Parkes seem misdirected. Before writing a letter to the editor, he might have consulted not only the oldest but also the most recent summary by Witschi (reference 3 of my report). He would have found color photographs, of various species and reactions, adequate to satisfy anyone more particularly interested in the taxonomic and technical aspects of the feather reaction. He might then, also, have followed a reference to a readily available paper [E. Witschi, *Endocrinology* 27, 437 (1940)] in which *weaver finch test* and *weaver finch unit* are introduced as technical terms. In accordance with good usage, these terms are clearly defined, and the reactions of *E. afra* are compared with those of several other species.

It should be evident to all readers that my short report in *Science* of 13 Dec. 1957 was meant to be a contribution to endocrine physiology. Taxonomic considerations do not necessarily enter into the discussion of assay materials such as I have presented. All data refer to a single species. Moreover, each individual bird serves as its own control. The positive or negative reaction of a bar across a single regenerated feather is always compared with the tip and the base which grew before and after injected hormone substances were present in the systemic circulation. With this I do not deny that taxonomic and physiologic variation in plumage characters of finches is a subject of interest. Publication of a large assemblage of data that I have collected in Iowa City over more than twenty-five years is, in fact, in preparation.

Regarding the quotation from Mayr, Linsley, and Usinger, there can be little doubt but that these three experts mean exactly what they say: namely, that the experimental biologists have learned to appreciate physiologic traits and differences. If "most taxonomists" are wise to it as well, for whom, Dr. Parkes, was their message intended?

EQUIPMENT NEWS

The information reported here is obtained from manufacturers and from other sources considered to be reliable. Science does not assume responsibility for the accuracy of the information. All inquiries concerning items listed should be addressed to Science, Room 740, 11 W. 42 St., New York 36, N.Y. Include the name(s) of the manufacturer(s) and the department number(s).

■ **SUPERCONDUCTIVE MEMORY** element, the Persistor, is designed for switching times as short as 10 msec. The device operates within a few degrees of absolute zero. The Persistor is a loop composed of segments of two metals, both maintained in a superconductive state. The passage of a critical current through one of the segments causes that segment to revert to its resistive state. The direction of subcritical current in the loop carries the information being stored and is determined by impressing an interrogating current pulse. (Ramo-Wooldridge Corp., Dept. S873)

■ **IRRADIATION CHAMBER** can safely contain up to 25,000 of Co⁶⁰ and can receive for irradiation a sample up to 10-in. in diameter by 10-in. long. The sample to be treated is placed on a tray in front of a large, electrically driven lead-filled block. Motion of the sample into the chamber is controlled by pushbutton. Locking of the chamber, moving of the source into position, irradiation of the sample, and removal of the sample are automatically controlled according to a preset cycle ranging from 1 min to 120 hr. Electrical and mechanical interlocks insure safety. (Budd Co., Dept. S874)

■ **VACUUM-TUBE VOLTMETER** permits measurement over the frequency range 100 cy/sec to 50 Mcy/sec with sensitivity to 250 μ v. Seven scales provide full-scale ranges from 0.001 to 1 v. Frequency response is ± 1 db. Accuracy is ± 10 percent of full-scale reading. Input impedance is 30 kohm and 5 μ mf at 50 Mcy/sec. (Kay Electric Co., Dept. S885)

■ **FURNACE** operates at 3300°F and at pressure of 3000 lb/in². The furnace charge can be observed or moved at full temperature and pressure. Temperature is held constant to $\pm 1^\circ$ F. Static and dynamic pressure seals are made with "O" rings. (Vacuum Specialties Co., Inc., Dept. S889)

■ **AUTOMATIC VOLTAGE REGULATOR** is designed to extend the life and reliability of electron tubes. When equipment is energized, voltage to the tubes is increased gradually to minimize surge strain on the filaments. A control circuit is automatically actuated at the proper
