

The Russians' Own Story of Artificial Satellites

SOVIET SPACE SCIENCE

By Ari Shternfeld

"Singularity free of propaganda . . . One of the best surveys of astronautics published in any country." **WILLY LEY**

Just published, this comprehensive new account of Russian theoretical and practical progress in the field of astronautics is written by a leading Soviet space scientist and now appears in English in the official U.S. Air Force translation. Here is the definitive history of the Soviet satellite program, with actual photographs, drawings, tables and technical data — much of it based on the author's own original research. Among the contents are: Plans for a Revolutionary "Fixed Star" Satellite, Construction of a Space Platform, Scientific Objectives of Space Flight, Design and Construction of Space Ships, Survival of Man in Space, Flights to the Moon, Problems of Re-entry into the Earth's Atmosphere, and many others.

Meetings

Autoradiography

A conference on autoradiography, sponsored by the American Cancer Society and the National Cancer Institute of the National Institutes of Health, was held at the Westchester Country Club, Rye, N.Y., 22-24 Sept. 1958. Thirty-five leaders in the field were invited to a "retreat" conference. Twelve of the participants were from Great Britain, Sweden, Denmark, Belgium, and Canada; the others were from the United States. Twenty-five scientific papers were presented and discussed.

A day was spent on theoretical considerations and technique. R. H. Herz (Kodak Ltd., Harrow) reported that latent-image fading of photographic emulsions, particularly in the AR-10 stripping film so useful to the biologist, might be greatly reduced, and the speed of the film doubled, by exposing the emulsion in an atmosphere of very low humidity and devoid of oxygen. J. Spence (Eastman Kodak Co., Rochester, N.Y.) emphasized the desirability of doing experimental control studies in autoradiography to evaluate accurately latent-image fading. The problem of the production of tritium (H^3) tracks in emulsion was discussed at some length.

Hilde Levi (Copenhagen) pointed out the quantitative validity of relative grain-counting and track-counting techniques but also the potential errors of these methods when G-5 liquid emulsion and C^{14} and S^{35} are used. J. E. Gullberg (University of California, Berkeley) emphasized the value of dark-field illumination for both the visual examination and the automatic, instrumental grain counting of autoradiograms. It was agreed that with this technique there is an increase in the number of visible events, both in the background emulsion and over the radioactive source, but there was no unanimity on the part of the discussants as to whether there was a gain or loss in signal-to-noise ratio.

W. Tolles (Airborne Instruments Laboratory, Mineola, N.Y.) discussed methods of automatic quantitation of autoradiograms. He indicated that the principles of the instrumentation used in the automatic scanning of Papanicolaou smears of exfoliated cells and utilized also in the design of a nuclear track scanner that counts the proton tracks in film badge emulsion might readily be applied to autoradiography. Practical difficulties such as a wide spread of density in a field or the overlapping of grains might become significant. S. Pelc (Kings College, London) reminded the group that the biologist in doing quantitative studies usually spends considerable time preparing his specimen and selecting the few areas that he wishes to measure. He

raised the question of whether it is profitable to build large-scale grain-counting instruments inasmuch as only a small fraction of the work involved is that of grain counting.

E. Odeblad (Caroline Institute, Stockholm) gave a mathematical evaluation of the density of photographic emulsions by a matrix system. This interesting approach to problems of resolution and "cross-fire" dosimetry has not yet been evaluated in terms of the results that have already been achieved by other techniques.

D. L. Jofte (Cancer Research Institute, Boston) discussed a technique in which fluid, nuclear-track emulsions are used with H^3 - and C^{14} -labeled isotopes. Its chief advantage seems to be speed and ease of processing large numbers of autoradiograms. L. Bélanger (Ottawa) showed how autoradiography could be used as a histochemical tool by studying the uptake of Ca^{45} and S^{35} in bone sections that had been incubated in a medium containing the isotope. Differences in uptake of Ca^{45} in normal and pathologic bone were indicated by the autoradiograms. R. L. Swarm (National Cancer Institute, Bethesda) used the uptake of I^{131} and S^{35} in autoradiograms of thyroid and cartilage transplants as a measure of the viability of the transplant.

A morning session was devoted to radiation effects and radiation carcinogenesis. H. Lisco (Argonne National Institute, Chicago) illustrated the pathogenesis of lung cancers secondary to the inhalation of plutonium by concomitant histological changes and autoradiographic distribution of the isotope. The experimental lesions resembled the Joachimstahl lung cancers of man. L. Lamerton (Royal Cancer Hospital, London) discussed the problems of dosimetry in evaluating radiation-induced bone cancers and pointed out the wide range of possibilities for the production of focal injury and subsequent carcinogenesis. The microscopic distribution of isotopes can be determined by thick-section autoradiography, and there is great need for this type of approach which, in combination with an assessment of histologic damage, is so important to the unraveling of problems in carcinogenesis.

Janet Vaughan (Oxford) discussed autoradiography and dose-rate measurements in bone and showed a correlation between the different types of damage observed and the different patterns of dose rate and total dose received in the tibia of rabbits receiving Sr^{90} . Bone tumors arose in the areas of maximum dose or maximum damage after intravenous injection. In the animals fed Sr^{90} , the site of origin of tumors appeared to be generalized in association with the more generalized distribution of maximum dose.

J. Arnold (Veterans Administration Hospital, San Francisco) showed that plutonium (Pu^{239}) is more diffusely concentrated in the lung and flat bones of dogs. With time and remodeling of bone trabeculae and at certain dosages of Pu^{239} the distribution is more diffuse and tends to resemble the Ra^{226} distribution. Dziewiatkowski (Rockefeller Institute) showed by autography the decreased uptake of S^{35} -sulfate in the epiphyseal plate of the tibia of the mouse after radiation.

An afternoon session was devoted to papers on nucleic acid, protein, and mucopolysaccharide metabolism. L. G. Lajtha (Oxford) pointed out many of the disadvantages of the tritium label in nucleic acid studies, in particular its radiation effects. There was considerable disagreement about the matter, the Brookhaven group being less convinced of the effect. All agreed that relatively little was known about many features of tritium, especially about its radiation effect.

S. Pelc (London) stated that the percentage of cells concentrating thymidine- H^3 is higher in many systems than the known rates of mitosis would lead one to expect. He concluded that deoxyribonucleic acid (DNA) metabolism might occur independently of any replication activities and have a turnover distinct from mitotic activities. There was considerable discussion about whether mitotic rates were as low as Pelc assumed or whether mitosis occurred as infrequently as he believed.

A. Ficq (Free University of Brussels) indicated that protein synthesis occurred in the salivary gland chromosomes of dipteran larvae and that there were areas of the chromosome which incorporated tritiated thymidine in high concentrations at certain stages of larval life.

I. Tessman (Massachusetts Institute of Technology) reported on the "star" technique of studying bacteriophage multiplication by pouring emulsion plates containing P^{32} -labeled DNA in bacteriophage particles. He compared the number of "stars" in parental T_2 phage with the number of "stars" in progeny resulting from the parental phage growth in bacteria, lysis of the bacteria, and the release of progeny phage. This technique shows that some progeny phage contain 20 percent as much DNA as the parental phage. The significance of this approach in terms of knowledge concerning the replication of DNA, as well as its importance in virus metabolism, were pointed out.

G. Asboe-Hansen (Copenhagen) used S^{35}O_4 and the Rous sarcoma to show that the mast cell, nongranulated metachromatic cells, and the extracellular ground substance incorporate S^{35} . Autoradiograms indicate that the mast cell is

High-speed precision balance saves time in research

SHADOGRAPH®

gives fast, positive stop reading
...eliminates parallax

Model 4142 Shadograph is recommended for weighing cancer tissue and tumors. Fully-enclosed weigh pan, easily removable for sterilization, is readily accessible through a clear plastic door. Unaffected by air currents. Weight indication by a light projection system gives fast, precise reading. Operates on 110 volts, 60 cycles. Rated capacity 15 grams; visible sensitivity to 5 milligrams. Movable dial viewer for 5 rows of graduations, each row 3 grams by 5 milligram graduations. Weight range selector has 5-notch beam corresponding to dial chart. Write for complete data and specifications.

SMALL ANIMAL BALANCE

Model 4203B-TC-SA recommended for fast, precise weighing of mice, chicks, frogs and small rats. Dial graduated in two columns: 0—30 grams and 15—45 grams in increments of 0.5 gram. Dial shutter with outside control to close off dial column not in use. Beam 100 grams by 1 gram. Other models up to 3 kilos, 350 milligram sensitivity for rats, hamsters and guinea pigs.

CENTRIFUGE BALANCE

Model 4206B-TC also for general laboratory use and small-animal weighing. Has tare control knob to zero the dial, or position for over-and-under reading. Capacity 3 kilos; sensitivity to 350 milligrams. Dial is graduated 0-100 grams in increments of 1 gram. Beam 500 grams by 5 grams.

not necessarily the origin of extracellular sulfomucopolysaccharides.

One session was given to tritium-labeled isotopes. C. P. Leblond (McGill) used thymidine- H^3 as an indicator of the replication rate, and he divided cells of the body into three groups on the basis of the percentage of cells labeled after the injection of thymidine- H^3 . In his study, the cells that turned over the thymidine- H^3 most rapidly were found to be those of the skin, the thymus, and the gastrointestinal tract. The cells that responded most slowly were those of the central nervous system and muscle. Activity for most other organs was between these limits.

E. Cronkite (Brookhaven National Laboratory, Upton, N.Y.) presented data on the life-cycle time determination, DNA synthesis, and the turnover of cells in the reticuloendothelial and marrow cells. The Brookhaven group emphasized that the percentage of labeled cells in an organ after a single, rapid injection of labeled thymidine is equal to the percentage of the total cell lifetime devoted to DNA synthesis. If DNA synthesis is assumed to be a prelude to division, a high percentage of labeling indicates that a large percentage of cells is preparing to divide. These investigators believe that there is a wide-

spread pool of primitive progenitor mesenchymal cells which is continually migrating and appears able to respond to many types of stress leading to repair, defense, or regeneration.

R. Painter (Brookhaven) used tritiated thymidine to determine subdivisions of the lifetime cycle of HeLa cells in tissue culture. W. Plaut (University of Wisconsin) raised questions about the damage to chromosomes caused by thymidine- H^3 and the effect upon conclusions drawn from tritium replication studies. In rebuttal, Taylor (Columbia) stated that the percentage of intrachromosomal changes and exchanges between sister chromatids of *Bellevalia* after irradiation did not increase in succeeding generations, thereby implying that since increasing exposure to radiation did not bring about an increase in radiation effects, the radiation effect was not great.

P. Woods (Brookhaven) showed that in plant cells cytidine- H^3 was quickly taken up in ribonucleic acid (RNA) of the nucleoli. When the cells were removed from a radioactive medium where they had been kept for a short period to allow for nucleolar labeling and placed in a nonradioactive medium to permit growth to continue, autoradiograms of the cells after some hours showed the label in the RNA of the cytoplasm. P. J.

Fitzgerald (State University of New York, Brooklyn) showed that in the rat the tritium of cytidine- H^3 was localized in the nucleolus of the pancreas acinar cells half an hour after injection, and at 24 hours was predominantly cytoplasmic. These two studies suggest that some RNA, or a portion of the RNA molecule, of the nucleolus passes into the cytoplasm.

The chairmen of individual sessions pointed out in summary the need for further parallel studies of radiation effect with respect to histologic damage, isotope localization, and dosimetry. They urged study of the range, absorption, and grain yield of tritium in photographic emulsions. Particularly emphasized was the lack of knowledge concerning the radiation effect of tritium on cell metabolism and replication. This was deemed most important in studies of such substances as tritiated thymidine, which concentrates in the DNA. The great value of tritium in cellular resolution warrants further study of these aspects of its use. It was emphasized that greater employment of biochemical techniques in conjunction with autoradiographic studies was desirable. The value of quantitative studies was reemphasized, but limitations and technical difficulties were noted.

Eastern "job-sized" pumps and stirrers save weight • space • power • costs

Eastern has just the right pumps or mixer for your laboratory or pilot plant application. The wide range of Eastern products lets you choose standard units so closely geared to the job that they might have been created just for it.

A complete engineering service to help you, and a big selection of more compact, versatile, high performance pumps and stirrers—this is the formula for your quick and easy choice.

Send for laboratory equipment bulletin No. 1540

A wide range... in midget pumps: centrifugal and positive pressure models—motors from 1/30 to 1/3 hp, capacities to 20 gph, pressures to 60 psi.

in variable speed stirrers: From 1/100 to 1/15 hp non-sparking motor with clamp or ring stand just right for your lab use.

EASTERN INDUSTRIES, INC.
100 SKIFF STREET • HAMDEN 14, CONNECTICUT

In the attempt to avoid delay in the publication of the proceedings of the conference, a stenotypist recorded the discussion, and each participant, within a few hours after his remarks, was given a typewritten copy of them for correction. Through this arrangement and the prompt submission of papers by participants, publication of the papers and discussion in the January-February 1959 issue of *Laboratory Investigation*—4 months after the conference—was made possible.

PATRICK J. FITZGERALD
State University of New York, Brooklyn

American Heart Association

Forms for submitting abstracts of papers intended for presentation at scientific sessions of the American Heart Association in Philadelphia, Pa., 23-25 October, are now available from Dr. F. J. Lewy, Assistant Medical Director, American Heart Association, 44 E. 23 St., New York 10, N.Y. Applications for space for scientific exhibits may also be requested from Lewy. Both abstracts and applications for exhibit space must be postmarked no later than 12 June. Space for industrial exhibits may be requested through Steven K. Herlitz, Inc., 280 Madison Ave., New York 16, N.Y.

This year for the first time the scientific sessions will include a joint program with the American College of Cardiology. The college, holding its eighth interim meeting concurrently, will conduct "fireside conferences" on the evening of 23 October in which AHA members will participate. On 25 October a panel on Cardiac resuscitation will be presented jointly by the college and the association's council on clinical cardiology.

Cold Spring Harbor Symposium

The 24th annual Symposium on Quantitative Biology will be held at the Long Island Biological Laboratory, Cold Spring Harbor, N.Y., 3-10 June. As part of its policy of fostering a closer relation between biology and other basic sciences, the laboratory each summer invites a group actively interested in a specific aspect of quantitative biology, or in methods and theories applicable to it, to take part in a symposium.

The topic this year will be Genetics and 20th Century Darwinism. Research findings will be presented during 16 sessions. Presiding over the opening session on the evening of 3 June will be I. M. Lerner of the University of California. Ernst Mayr of Harvard University will present the opening paper.

Participants from abroad will include: Hans Stubbe of the Institut für Kultur-

pflanzenforschung, Gatersleben, East Germany; A. A. Buzzati-Traverso of the Universita di Pavia, Pavia, Italy; M. Lamotte, Ecole Normale Supérieure, Paris; F. H. W. Morley, Commonwealth Scientific and Industrial Research Organization, Canberra, Australia; A. E. Mourant, Lister Institute, London, England; L. L. A. Coutinho, Estacao Agronomica Nacional, Lisbon, Portugal; Franz Schwanitz, Staatsinstitut für Angewandte Botanik, Hamburg, Germany; N. A. Barnicot, University College, London; P. M. Sheppard, University of Liverpool, Liverpool, England; F. Ehrendorfer, University of Vienna, Vienna, Austria; B. Kurten, University of Helsinki, Helsinki, Finland; G. Heberer, Universität, Göttingen, Germany; Pierre Dansereau, University of Montreal, Montreal, Canada; S. Smith-White, University of Sydney, Sydney, Australia; and B. Rensch, Universität, Munster, Germany. For additional information, write to: Dr. Arthur Chovnick, Biological Laboratory, Cold Spring Harbor, N.Y.

Pharmaceutical Companies Aid International Physiological Congress

As it has done in the past, the American pharmaceutical industry has responded to a request for financial support of a triennial International Physiological Congress; this one, the 21st, is to be held in Buenos Aires, Argentina, 9-15 August.

The following companies have contributed: Burroughs Wellcome & Company, Inc.; Ciba Pharmaceutical Products, Inc.; Hoffmann-La Roche, Inc.; Eli Lilly & Company; Merck & Company, Inc.; Merrell-National (Overseas) Laboratories; Miles Laboratories, Inc.; Olin Mathieson International Corporation and the Squibb Institute for Medical Research; Smith, Kline & French Laboratories; and the Upjohn Company. The total amount is \$8100.

This assistance is particularly significant because the forthcoming congress is both the first to be arranged in one of the South American Countries and the first to be held under the auspices of the International Union of Physiological Sciences.

Nuclear Society and Atomic Industrial Forum

The American Nuclear Society and the Atomic Industrial Forum have announced plans to conduct a series of coordinated meetings. The two organizations are the largest in the country concerned exclusively with nuclear energy and radiation.

These meetings are planned to bring

15 MAY 1959

*Pat. App'd. for

Model LRA Shown set up for continuous flow operation (Cover normally closed)

The model LRA is the first automatic refrigerated centrifuge of its kind. Like the non-automatic Model LR, it has the newest and most efficient refrigeration design ever introduced. By proper placement of cutouts, baffles and deflection plates, a smooth forced air circulation system is set up. The warm air coming off the rotor flows around large surface area cooling coils on the side and bottom of the chamber. Upon emergence in the cooled form, the air flows onto all portions of the rotor. This system permits the cooling of any Lourdes' rotor from ambient to 0°C within ten minutes by spinning at slow speed. Rotor temperatures are easily maintained at 0°C and lower during full speed extended runs, and as low as -15°C at lesser speeds or for shorter runs.

By merely throwing a toggle switch, a 1 Hp. motor automatically accelerates any rotor to a pre-set speed. Lourdes' electrodynamic push-button braking system provides for smooth rotor stopping in a fraction of unbraked stopping time. A time delay relay releases the braking action at slow speed and permits the rotor to stop naturally without disturbing the sediment. This same centrifuge is now available with a ½ Hp. motor drive (Model LRA-1) to provide higher speed and force with the smaller rotors.

Each centrifuge comes adapted to accommodate the new Lourdes' continuous flow system at no additional cost. The continuous flow rotors with polyethylene liners, in addition to ease of operation, assembly and disassembly, also offer fast flow rate, high speed and force and greater collection capacity than any comparable continuous flow centrifuge. New time saving applications for these rotors are being discovered daily.

Every Lourdes' instrument is guaranteed for a period of one year and this guarantee insures customer satisfaction.

into focus the latest developments in both the technical and business phases of the peacetime uses of the atom. Independent sessions covering these two different aspects of nuclear science are planned. A partial overlapping of the meeting schedules of the two organizations is intended to be a constructive step toward the avoidance of duplicate travel.

The American Nuclear Society, founded in 1954, has a professional membership of around 3000 from all branches of nuclear science and technology. The Atomic Industrial Forum is a nonprofit membership association of more than 500 industrial and other business organizations, research and service companies, labor groups, and educational institutions engaged in the development and utilization of nuclear energy for constructive purposes.

Present planning includes coordinated meetings in the fall of 1959 in Washington, 1960 in San Francisco, and in 1961 in New York. Both organizations will continue to hold additional individual meetings throughout the year.

Isotope Effects

Argonne National Laboratory will conduct a conference on isotope effects in chemistry and biology on 8-9 June. The conference, sponsored jointly by the divisions of chemistry and of biological and medical research, will present a program of 14 papers concerned with the effects of isotopic substitution on chemical and biological processes. Further information may be obtained by addressing Miss B. Litt, Isotope Effects Conference, Argonne National Laboratory, P.O. Box 299, Lemont, Ill.

Symposium on Electrolytes

The program of the Trieste congress of the Societa Italiana per il Progresso delle Scienze, 4-9 June, will include a symposium on electrolytes. P. Debye of Cornell University will be honorary chairman of the symposium and opening speaker; the program chairman is professor Raymond M. Fuoss of Yale University.

Colloquium of College Physicists

The 21st annual Colloquium of College Physicists and the Associated June Lectures will be held at the State University of Iowa, Iowa City, 17-20 June. The program will consist of lectures on developments in contemporary physics and round-table discussions on the teaching of physics and on other current problems of the profession. One evening will be devoted to the exhibit of original

demonstration equipment and other teaching devices prepared by the participants.

The Associated June Lectures will be given by Thomas Gold, professor at Harvard College Observatory, on magnetic fields and particles in the solar system and on large-scale structure of the universe.

Registration is without fee. The colloquium is assisted by the National Science Foundation.

Electron Microscopy

The 17th annual meeting of the Electron Microscope Society of America will be held 9-12 September at Ohio State University, Columbus. Special attractions of the meeting include symposia on the contributions of electron microscopy of viruses and cells to the problem of cancer, elementary techniques of electron microscopy from the point of view of experts, and problems in the electron microscopy of ceramic materials. Information concerning the meeting may be obtained from: Sydney S. Breese, Jr., program chairman, EMSA, Plum Island Animal Disease Laboratory, Greenport, N.Y. The deadline for 150-word abstracts of contributed papers is 1 June.

Embryology

The editorial board of the *Journal of Embryology and Experimental Morphology* is sponsoring the fourth of its series of international embryological conferences at the College de France, Paris, from 21-24 September. Details of its organization and scientific program will be available on 1 June and can then be obtained from Prof. E. Wolff, Laboratoire d'Embryologie Experimentale, 49 Avenue de la Belle Gabrielle, Nogent-sur-Marne, France, or from Dr. L. Brent, Department of Zoology, University College, Gower Street, London, W.C.1, England.

Geology Teaching

Thirty school science teachers and professional geological scientists from all parts of the country will participate in a 6-week conference at the University of Minnesota, Duluth, from 20 July to 28 August, to prepare improved materials for the teaching of geology in school science programs. The Duluth conference, which is being sponsored jointly by the American Geological Institute and the University of Minnesota, Duluth, is a part of a broad and continuing program of public education by the institute. The conference is being conducted with the financial assistance of

the National Science Foundation. Robert L. Heller, associate professor and head of the geology department on the Duluth campus, has been selected by AGI to serve as director for the conference.

The conference will open with an orientation period of several days, after which the science teachers and geoscientists will be organized into small groups to consider specific problems. Under Heller's guidance, existing geology teaching materials now are being assembled, inventoried, and classified in advance of the summer session. These

will be evaluated and supplemented by the conference. The materials produced and evaluated during the Duluth program will be tested, reviewed, and revised following the conference prior to distribution.

Vascular Disease

Leaders in vascular medicine and surgery will meet in Atlantic City, N.J. on 5-7 June, at the World Conference of Angiology, sponsored by the American College of Angiology and the Angiology

Research Foundation. The conference will honor the tenth anniversary of the journal, *Angiology*, and the Angiology Research Foundation, and will mark the first time that an international meeting devoted exclusively to vascular disease has been held in the United States. Participants will come from Europe, Asia, South America, and North America.

David B. Allman of Atlantic City and Thomas W. Mattingly, U.S. Army Medical Corps, have been elected as honorary cochairmen of the conference. Alfred Halpern, president of the Angiology Research Foundation, Saul S. Samuels, editor-in-chief of *Angiology*, and Paul S. Lowenstein, president of the American College of Angiology, will be the chairmen for the meeting.

The overseas speakers will include: Gunnar Bauer (Sweden), Rene Fontaine (France), George Arnulf (France), H. Paessler (Germany), Max Hochrein (Germany), Edmondo Malan (Italy), Alex Dimtza (Switzerland), Kaindle (Austria), A. M. Boyd (England), Hans Selye (Canada), and Alfonso Albanese (Argentina).

A dinner and reception will be held on 6 June, when Charles Mayo of the Mayo Clinic will be the principal speaker. For further information, write to the World Conference on Angiology, 11 Hampton Court, Great Neck, N.Y.

Rheumatic Diseases

Leading rheumatologists and investigators from the Western Hemisphere will report their latest findings to the second Pan-American Congress on Rheumatic Diseases, 2-6 June, in Washington, D.C. Some 88 papers will be presented during the plenary sessions on 3 and 4 June at the main auditorium of the Clinical Center, Bethesda, Md., and during the concurrent sessions, 5 and 6 June, at the Hotel Mayflower.

The congress will be officially opened by Christian A. Herter, Secretary of State, at the Pan-American Union Building on the evening of 2 June. Arthur S. Flemming, Secretary of Health, Education and Welfare, will also speak that evening.

Clay Conference

The eighth National Clay Conference will be held at the University of Oklahoma, Norman, 12-14 October, under the auspices of the clay minerals committee of the National Academy of Sciences-National Research Council. Symposia of invited papers will be held on the clay-and-water systems and on geochemical prospecting for clay minerals. In addition to these special symposia, there will be general sessions of con-

Less than 0.007% Ash— for Highest Accuracy

left: Platinum crucible,
with 20 gr. S&S Ash-
Free Filter Paper

below: Crucible after
completed incineration

Ask for S&S "Ash-Free" Analytical Filter Papers

For many years S&S Ash-Free Analytical Filter Papers have been known for their extremely low ash content. They have been the choice of chemists who must have the most precise working tools.

To our knowledge, there is no filter paper with lower ash content on the market. In fact, ash content of S&S Quantitative Papers is considerably lower than all other papers we have tested—less than 0.007%.

Ask your laboratory supply house for S&S Analytical Filter Papers—the finest, most precise filter paper you can specify. Yet S&S quality costs no more. If you would like to receive a free S&S Filter Paper Sampler, made up of many grades, just mail the coupon below.

"A simple method is the practical path to precision"

This is the most practical pH meter ever made

COMPAX is so simple, so extremely easy to use, that you'll wonder why all pH meters aren't made this way.

The ingenious **COMPAX** design employs ultra-modern components to save space, maintenance *and your operating time*. You use one control, read from a dial, work with handy Coleman Electrodes. Precision is 0.02 pH.

Make no mistake . . . this is not a short-cut portable. **COMPAX'S** high efficiency and low cost (only \$200.00) are the result of modern engineering for mass production.

Skeptical? . . . **Try it before you buy it!** Clip this coupon to your letterhead and mail to us for a free trial. No strings attached.

Nuclear Instruments

AIR MONITORS

Automatically record and warn of α , β and γ radiation in airborne particles for periods up to one week, unattended. Fixed or moving filters. Standard and custom units or complete systems.

PROPORTIONAL COUNTING SYSTEMS

For precision counting of α , β and γ radiation from prepared samples. Ideal for C^{14} , Ca^{45} , P^{32} and H^3 . New low power design reduces heat, assures longer life.

COUNT RATEMETERS

Operate GM, scintillation and proportional counting detectors. Equipped to drive recorders and alarms. Logarithmic or linear models for monitoring or laboratory use.

PORTABLE SURVEY METERS

High precision, compact, portable Geiger and scintillation counters. Critical components shock mounted and watertight. For precise laboratory measurement or rugged field use.

3 ways to get the automatic burette you need

1. Order this one from us. It's identified as item 90850, and accuracy tolerances are as established by the National Bureau of Standards Circular C-434. To make sure you get accuracy between any two points, precision bore tubing is used in the graduated portion. Four sizes — 10, 25, 50, and 100 ml; bottles have capacities of 1000, 1000, 2000, and 4000 ml, respectively.

2. Check pages 199, 200, and 201 in our LG-1 Catalog. This is the section on "Custom" labware. You'll find five other automatic burettes (in addition to the one shown, that is) detailed on these pages. You can get delivery from your regular lab supply dealer. Or you can order direct from us.

3. Send us a sketch. Tell us what you need. Maybe it's a ground joint instead of a stopper, for example. Or, perhaps, instead of a variation you need something completely different. Sketch it. Our skilled lampworkers will do the rest, fashioning what you request from famous PYREX brand glass No. 7740, the glass that's been the standard for labs for years.

If you don't already have a copy of LG-1 on hand, ask for it. Likewise for the NEW Supplement No. 3. Or send us that sketch. In any case, you'll get what you need, in a hurry.

Millipore BRIEF #155

Identification of Micron and Submicron Particles.

Techniques are described for identification and size estimation of water or acid-soluble atmospheric particles. After collection, MF filter is placed on appropriate reagent solution (from 3 to 20 minutes). Filters are then washed, dried, mounted and microscopically examined (dark field) for characteristic reaction "spots." Reagents and spot characteristics are given.

Lodge, J. P., Jr., Tufts, B. J.
Tellus
VII, 1956, 2

Millipore BRIEF #201

Methods for the Evaluation of Pasteurization.

Two methods, one enzymatic and one microbiological, are described to test beer for adequacy of the pasteurization received. The second method uses an HA Millipore filter to retain all organisms from a beer sample. Yeast colonies will develop on the MF in 36 to 48 hours on hopped wort at 23°C. Lactobacilli and pediococci develop on the MF in 6 to 14 days on hopped wort agar in CO₂ atmosphere at 23°C.

Haas, G. J., Fleischman, A. I.
Wallerstein Laboratory Communications
XX:68, March, 1957

ABSOLUTE SURFACE RETENTION OF ALL PARTICLES LARGER THAN PORE SIZE

Particles screened from liquids or gases lie directly on the surface of the Millipore filter — in a single plane — where they may be readily examined or tested. Fluids cleaned with 100% cut-off at specific pore size.

- 50 million capillary pores of precise size per sq. cm. of surface area.
- Absolute surface retention of all particles larger than pore size.
- Pores are 80% of total filter volume, permitting high flow rates.
- Heat and chemical resistance characteristics typical of esters of cellulose.
- Filter becomes completely transparent for microscopy by applying immersion oil.
- Ten porosity grades from 0.01 μ to 5.0 μ .
