STUDYING MOLECULES IN DEPTH

*... with precision
research instruments
from Beckman*

ANALYTICAL ULTRACENTRIFUGE — Model E

A fundamental instrument for characterizing molecules by recording their behavior in a centrifugal field. Measures molecular weight, sedimentation coefficient, purity, homogeneity, activity coefficients.

Can study organic and inorganic molecules with molecular weights from a few hundred to several million, at reduced, ambient, or elevated temperatures.

PREPARATIVE ULTRACENTRIFUGE — Model L

Generates forces of nearly 200,000 g for isolating and concentrating viruses, cytoplasmic particles, enzymes, proteins, and a variety of smaller macromolecules.

Features refrigeration and a vacuum system. Swinging bucket rotors allow density gradient studies, both preparative and analytical.

ELECTROPHORESIS DIFFUSION — Model H

For extreme precision in measuring diffusion coefficients/ for free electrophoresis studies featuring automatic photography by schlieren, Rayleigh fringe, and Gouy fringe optical systems. Measurements are reproducible to better than 1/25 fringe.

AMINO ACID ANALYZER — Model 120

Provides automatic ion-exchange column chromatography as a basic laboratory means for separation, collection, identification and quantitation of amino acids, peptides and related compounds in studies of protein hydrolyzates, physiological fluids, tissue extracts, foods, culture media, pharmaceuticals.

N.B.Co. DELIVERS BIOCHEMICALS, NOT EXCUSES!

A little water won't dampen our service. If your laboratory's on an island, our biochemicals *reach* your island . . . dry. You can plan on 24-hour delivery in the U.S.A., a bit longer anywhere else. You can also plan on your order *being* your order. N.B.Co. is strong on accuracy, triple checking every order and every mailing label. Strong on supply, too, with 2600 different biochemicals to fill your every requirement. You'll want to keep N.B.Co.'s 2600-item catalogue in your files. And remember, N.B.Co. has the world-wide volume that brings you pure

biochemicals at lowest prices. If you know what you need and need it today, call MONTROSE 2-0214, Cleveland, Ohio.

MODEL M5P MINI-POLYGRAPH

- *Fully modular*
- *2 to 5 channels*
- *Rectilinear recording*
- *Simultaneous 8" servo and other records on one graph*
- *Compact versatility—up to 4 chopper, ECG, or EEG channels in any assortment—up to 2 servos...for a total of 5 channels*

- Each channel a complete, self-contained interchangeable unit
- One or two servos may be used, writing the full width of 8" chart. Sensitivity up to 6 millivolts full scale, traverse time approximately 1 second
- Chopper amplifiers, for pressure or force with a Statham transducer, or for temperature with a thermistor bridge. Include Zener diode regulated power supply for bridge. May also be used as stable high gain DC amplifiers
- Time and event markers included
- Rectilinear recording — simple and reliable linkage with only two moving parts
- Transducers plug in directly — no extra power supply or pre-amplifiers needed
- Ease of record analysis — the servo record is on the same chart as other records (EEG, ECG, pressure, etc.) — all on 8"-wide fan-folded paper with millimeter square marking
- Anti-clogging inking system
- Instantaneous speed change without gear shifting — 6 speeds
- Rugged and sturdy construction

**AT THE MOMENT OF DECISION ...
MORE POSITIVE DIAGNOSIS**

To provide more positive diagnosis ... to speed slide preparation ... to perfect it technically and thereby produce exceptional cytological detail in thin undistorted sections ... these are the aims and accomplishments of International's new model CT Microtome Cryostat.

Everything necessary for precise, frozen sectioning has been conveniently packaged in one superbly engineered compact instrument. From fresh tissue to finished slide in minutes. There is a new, integral Freon fast freezing arrangement. Controlled temperatures from -10°C to -20°C are held even with the top open. Laboratories significantly speed their service. Pathologists get the best possible sections to help them achieve diagnostic certainty even under pressure of time. Write for our latest brochure.

Baird-Atomic introduces a new AUTOMATIC SAMPLE CHANGING SYSTEM

This simplified system incorporates the latest techniques and instrumentation for automatic detection, timing, counting and data presentation. It accommodates up to 35 samples, processes and records results including sample number, time, count and, on request, count rate. The overriding time and count functions are performed by the new B/A Model 135 Scaler-Timer.

Heart of the new B/A System is the Model 755 sample changer that assures positive, jam-proof operation because of its simple casted construction. It is specifically designed for geiger or proportional counting but its flexible detector mount-

ing permits the use of scintillation probes for gamma counting.

For complete details, call or write your nearest B/A representative today.

Sales and service offices in: Cambridge, New York, Philadelphia, San Francisco, Cleveland, Washington, D. C., Atlanta, Dallas, Chicago, Los Angeles, Pittsburgh, Detroit, Ottawa, Canada.

Engineers and scientists: Investigate the challenging opportunities with B/A. Write Industrial Relations Director. All qualified applicants will receive consideration for employment without regard to race, creed, color or national origin.

Costly Cash

Anyone who visits the science departments of a fair sample of our most eminent universities will be impressed by the high quality of the scientists, the diversity of research projects, and the plentiful supply of the complex and expensive instruments essential to modern scientific research. But another impression is equally unavoidable: many first-class men and their instruments for research are housed in hallways partitioned off to serve as makeshift laboratories, in converted basement rooms, or in jerry-built "temporary" buildings put up during the second or even the first world war.

A complete account of the reasons for the disproportion between the support of men and equipment and the provision of adequate housing would require an extensive study of the relation between universities and the federal government and of the policies that govern expenditure of funds for research from public and private sources. In its main outlines, however, the explanation is at hand. During World War II the federal government began to assume major responsibility for the support of research in educational institutions, through the Office of Scientific Research and Development. This support has since been continued by a number of successor agencies. The most general practice is for the agencies to provide support for research projects and training—support that includes funds for technical assistants and for equipment but not for laboratory space. Funds for new buildings for scientific or medical research can be obtained only on a matching basis. And it is here that the account becomes complicated. One reason universities find it so difficult to find matching funds for buildings is, paradoxically, that the grants for project research do not provide enough money to pay the indirect costs.

In a recent study at Harvard, one of 23 now under way with the support of the Carnegie Foundation for the Advancement of Teaching, it was estimated that while spending \$11.9 millions of federal funds for project research, the university incurred an obligation for unreimbursed indirect costs of \$687,000.

On the basis of a formula worked out by the U.S. Bureau of the Budget, Harvard determined that 28.5 percent of the total costs was an allowable charge for indirect costs on research projects. Some federal agencies paid this amount, but HEW is limited by law to a 15-percent charge for overhead, and the NSF has only recently gone from 15 to 20 percent. Every research grant accepted thus cuts into the general funds that might be used for matching grants or, so far as that goes, for operating university departments outside the sciences.

According to the Harvard study there are additional matters for concern: the concentration of research money in only a few institutions; the threat to the balance between the humanities and the sciences; and the heavy emphasis on research at the expense of teaching.

Piecemeal support by diverse federal agencies means that no agency considers the effects of its operations on higher education as a whole. What is the proper formula for indirect costs? When the Carnegie-supported studies of the relation of the 23 universities to the federal government are completed, government and the universities can better appraise their joint responsibilities for education and research, and for bricks and mortar.—G.DuS.

NEW

The PACKARD ARMAC[®] Scintillation Detector...

A compact, wholly self-contained liquid scintillation detector that can be used as a whole body counter for small animals, as a radioactivity counter for bulk samples of foods, soils and other materials, and as an arm-only counter on humans.

This versatile and economical new instrument enables the research worker to count even natural levels of radioactivity conveniently. Because of the great sensitivity and excellent counting geometry of the ARMAC Detector, high counting rates can be obtained with the administration of very small amounts of radio-nuclides . . . only 1/100 to 1/1000 of maximum permissible levels.

A complete system consists of the ARMAC Detector and a Model 410A Auto-Gamma Spectrometer, both mounted on a mobile housing. Provision is made for addition of automatic data read-out or ratemeter presentation. Complete information can be obtained from your Packard Sales Engineer or by writing direct to the company.

Plant Phenolics

The recent increase of interest in the biology and chemistry of the phenolic constituents of plants becomes immediately apparent on inspection of the table of contents of many of the world's biological and chemical publications. However, workers in the various fields in which there is an interest in the plant phenolics are widely scattered throughout departments of botany, biology, biochemistry, chemistry, microbiology, pharmacy, pharmacology, and forestry, in universities, research institutes, government agencies, and industry. There is consequently almost no common meeting place for people with such interests, with the result that there is little discussion and exchange of information between workers in the different disciplines.

In 1956 the Plant Phenolics Group was founded in England as an informal organization with the aims of promoting "the advancement of the knowledge of phenolic and related constituents of plants in respect of their chemistry, function, biosynthesis, effect on plant and animal physiology and pathology, and the application of such knowledge in agriculture and industry." Since its founding the Plant Phenolics Group has been very successful in achieving these aims, holding two or three meetings per year. The proceedings of many of these meetings have been published.

At the 9th International Botanical Congress in Montreal in 1959, discussions with various biochemists and physiologists interested in plant phenolic substances led to the idea that a sister organization be formed in North America. The largest problem involved in forming such a group on this continent, of course, results from the geographical size of North America, which would prohibit such a group from meeting more often than once a year.

An organizing committee consisting of T. A. Geissman (University of California), V. C. Runeckles (Imperial Tobacco Company of Canada), and G. H. N. Towers (McGill) distributed a letter to interested persons in 1960, the response to which was so enthusiastic as to encourage the committee to make plans for an inaugural meeting. This was held at Colorado State University, Fort Collins, from 31 August to 1 September 1961, and took the form of a symposium on the bio-

chemistry of plant phenolic substances. The meeting was sponsored by the National Science Foundation, under the direction of G. Johnson (Colorado State University) and T. A. Geissman.

Papers were presented as follows: "Recent studies on the structures and bitterness of the flavonoid glycosides of citrus" (R. M. Horowitz, U.S. Department of Agriculture); "Biosynthesis of plant phenols" (S. A. Brown, National Research Council, Saskatoon); "Naturally occurring biflavonyls" (N. Kawano, University of Nagasaki); "Metabolic fate of phenolic substances in animals" (A. N. Booth, U.S. Department of Agriculture); "Role of plant phenolics in disease resistance and immunity" (I. Uritani, Nagoya University); "Melanin and its formation" (G. A. Swan, University of Durham); and "Estrogenic-like substances in plants" (E. M. Bickoff, U.S. Department of Agriculture).

Over 60 delegates attended the symposium, the last session of which was devoted to founding the Plant Phenolics Group of North America. The officers elected were as follows: president, S. H. Wender (University of Oklahoma); vice-president, L. Jurd (U.S. Department of Agriculture); and secretary-treasurer, V. C. Runeckles.

It was agreed at the founding meeting that membership be open to all persons interested in the Group's aims, on application to the secretary, Dr. V. C. Runeckles, P.O. Box 6500, Montreal.

Philbrick makes the most complete line of operational amplifiers

Now you select your performer
from two lines of octal plug-in

PHILBRICK OPERATIONAL AMPLIFIERS

K2 Series . . For efficient and foolproof differential amplifier operation, the popular Philbrick K2 modular plug-ins still satisfy all but the most exacting requirements at a price far less than it would cost to build them yourself.

SK2 Series . . For higher performance, for extra long periods of drift-free uninterrupted service, try these new SK2 plug-ins. They are interchangeable with the K2's both electrically and physically, and their low price will amaze and delight you.

	K2-W Differential Operational	K2-XA Differential Operational	K2-P Stabilizing	SK2-V Differential Operational	SK2-B Booster Follower	SK2-P Stabilizing
Open Loop DC Gain	15,000	30,000	1000	100,000	+3.5	2000
Output	±50v 1ma	±100v 3ma	—	±100v 3ma	±100v 20ma	—
Unity Gain Crossover	400 KCPS	500 KCPS	—	1 MCPS	—	—
Unit price*	\$22	\$27	\$52	\$58	\$36	\$65

Each K2 has a premium counterpart for use in exacting military and industrial applications.

The K2's have always been the lowest priced operational amplifiers. The new prices above make them even lower. These reductions are now possible because of production economies resulting from the continuing rise in demand for K2's. Improvements, too, will be noted. (The familiar shape has been retained, but the gold color has been changed to a computer grey.) More important, new plastics replace the old to achieve higher impact strength, higher temperature operating characteristics, and higher dielectric strength and reduced leakage.

The SK2 family offers you the same plug-in conveniences as the K2 family, but the higher performances shown provide more speed and accuracy when you design instrumenting, computing, and controlling devices. The dependability of the SK2's is assured by the following design features: all elements are severely derated; the ventilated cases are all-aluminum; components are mounted on epoxy glass terminal boards; and a glass-to-metal header minimizes leakage and noise. Furthermore, SK2's can be secured to the chassis, which acts as a heat sink.

We invite you to acquaint yourself with Philbrick's wealth of applications literature. Write for specifications, prices, and 28-page applications manual.

WHY LIQUID NITROGEN PROVIDES THE MOST SATISFACTORY SYSTEM FOR PRESERVING BIOLOGICAL MATERIALS

To preserve biological materials indefinitely, very low temperatures are required. Only at temperatures below -130°C . (202°F .) is all chemical and physical activity reduced to a negligible level.

Only with liquid nitrogen (-196°C ., -320°F .) can you obtain safe, economical *long-term* storage . . . for months, years, even centuries.

Liquid nitrogen does not react with the materials with which it comes in contact. It has no effect on the pH of solutions.

HOW LINDE PROVIDES USERS OF LIQUID NITROGEN WITH A MORE COMPLETE SERVICE THAN ANY OTHER SOURCE

Only LINDE provides *Total Liquid Nitrogen Service*—freezing equipment, refrigerating storage equipment, and nationwide availability of liquid nitrogen.

THE BF-1 FREEZER—a new liquid nitrogen freezer especially designed for laboratory use. Accurate and automatic control of optimum cooling rates. Provides a low-cost freezing system suitable for use with most types of biological specimens.

LNR-25-B REFRIGERATOR—non-mechanical, keeps 348 cubic inches of product between -185°C . (-300°F .) and -196°C . (-320°F .). Low evaporation loss; all-welded stainless steel construction (larger sizes available).

SERVICE AT YOUR DOOR—thanks to LINDE's unique distribution network, no point in the U. S. is more than a few hours from a ready supply of LINDE liquid nitrogen.

FIND OUT—write today for our new pamphlet, "The Preservation of Biological Materials with Liquid Nitrogen." Address: Linde Company, Division of Union Carbide Corporation, 270 Park Avenue, New York 17, N. Y. *In Canada*, Union Carbide Canada Limited, Linde Gases Division, Toronto 12. Or call your nearest LINDE office.

INEXPENSIVE "SCIENCE" BINDERS

Keep your copies of **SCIENCE** always available for quick, easy reference in this attractive, practical binder. Simply snap the magazine in or out in a few seconds—no punching or mutilating. It opens **FLAT**—for easy reference and readability. Sturdily constructed, this maroon buckram binder stamped in gold leaf will make a fine addition to your library.

Starting January 1962, **SCIENCE** Binders will hold one three-month volume of **SCIENCE**. They will have a 2½" back and 13 flat fasteners. \$3.25 each. Four binders, \$12.00.

For six-month volumes, through December 1961, **SCIENCE** binders with 4" back and 26 flat fasteners are available. \$3.25 each.

Add 50¢ for orders outside the U.S. Name of owner, 75¢ extra; year of issues, 50¢ extra.

Letters

(Continued from page 2007)

The implication is ridiculous that the principle of adding extra phases to a material to strengthen it is a logical development of any kind of recent theoretical thinking, let alone a fruit of the state of confusion that has developed from the highly specific models which have been described in metallurgical literature. It seems quite apparent that the work reported by Kingery could have been accomplished by a clear-thinking scientist (which Kingery is, in my opinion) with a classical point of view on strengthening of materials, as opposed to a view of the kind that is arrived at by overdevelopment of oversimplified mechanistic hypotheses. For instance, must we consider dislocation theory the basis for the following statement by Kingery: "As found from long experience with metals, plastics, and ceramics, the kinds of alloys which are most useful under these conditions are those made with stable second-phase additives having useful properties"? The most useful two-phase material discussed by Kingery can be derived and explained on a purely classical basis, with no regard whatsoever for dislocations, whether edge or screw.

It is interesting to attempt to follow Kingery's conclusions about the virtues of adding glass fibers. First of all, it is not clear how fibers will limit the stress induced in ice to a *minimum* value. Second, I fail to see in Kingery's Table 1 the more than tenfold increase in strength from Fiberglas additions that he finds.

In his enumeration of requirements for fibers to be effective in reinforcing materials, Kingery has omitted the third essential feature of the system: good adhesion must be achieved at the fiber-matrix interface. Again, no knowledge of dislocations is required to derive this.

JAMES E. McNUTT

Wilmington, Delaware

McNutt's opinion that dislocation theory has been of marginal "usefulness" for developing improved alloys is a minority, but not uncommon, opinion among metallurgists. It is probably true that the scientists who have contributed most to dislocation theory have contributed least to alloy development. The argument that technological improvements would have been made with equal facility without a background of understanding based on dislocation

theory is difficult to refute when, in fact, there are few, if any, competent alloy developers unaware of dislocations. At the present time, dislocations are a significant part of the "classical point of view on strengthening of materials."

I think there can be no dispute about the utility of dislocation theory for "rationalizing observed strengths." A glance through any contemporary symposium volume on fracture, deformation, or mechanical properties makes it clear that dislocation theory forms the foundation for any science (as opposed to technology) of mechanical behavior of materials.

W. D. KINGERY

*Ice Research Laboratory,
Massachusetts Institute of Technology,
Cambridge*

Medical Instrumentation

Duncan A. Holaday is to be commended for his excellent survey "Where does instrumentation enter into medicine?" [*Science* **134**, 1172 (1961)]. He perhaps was more harsh in some of his criticism than someone outside the medical profession could be. However, his solutions to the dilemma—to train physicians in engineering and to bring engineers into hospitals—pose further dilemmas.

Let us consider the first problem: Where does a physician get such training? Only one or two institutions offer a training program honestly aimed at instrumentation. The several biomedical engineering programs offered elsewhere are directed toward developing an engineer with cross-disciplinary training for research—not a man who is a specialist at measurement.

Measurement systems are largely electrical or electronic, so one would expect to find electrical engineers with the necessary training. However, instrumentation is an unwanted by-product in most university electrical-engineering departments. The trend is toward training physicists for applied research, and instrumentation is no longer "respectable."

In any attempt to bring the engineer into the hospital there are two distinct obstacles. First, nonengineering administrators generally have little understanding of what an engineer is, beyond "someone who knows about electronics, radios, and so on." Consequently, in all but a few hospitals the

22 DECEMBER 1961

Reduce analysis time...improve peak height sensitivity...insure complete analysis...make columns more versatile...all with the new Beckman Thermotrac* Temperature Programmer. Linear, non-linear, and step function programming—all on the same instrument, in the same or successive gas chromatograph runs. Rate-to-rate switching is not required.

Thermotrac is simple to operate. Plot the program with ink, pencil or black tape on the Mylar format sheet, insert, set zero and span. Optical follower changes column temperature as plotted. Programs are reproducible, and any 60-minute or shorter cycle can be plotted. Rapid temperature rise, cooling, and equilibration characteristics minimize operator effort. Simultaneous programming of sample and reference columns insures base line stability, while solid-state electronics permit proportional temperature control, maintaining temperatures to $\pm 0.1^\circ\text{C}$ through 350°C . Designed for direct use with Beckman GC-2 and GC-2A Gas Chromatographs, the Thermotrac is adaptable to virtually any laboratory gas chromatograph.

For full information, see your Beckman laboratory apparatus dealer, or write for Data File 38-51-04.

THE HUMAN INTEGUMENT NORMAL AND ABNORMAL

Editor: Stephen Rothman 1959

AAAS Symposium Volume No. 54

A symposium presented on 28-29 December 1957, at the Indianapolis meeting of the American Association for the Advancement of Science and cosponsored by the Committee on Cosmetics of the American Medical Association and the Society for Investigative Dermatology. The volume offers a fair illustration of what has been achieved by modern research in cutaneous physiology and pathophysiology.

270 pp., 59 illus., index, cloth. \$6.75
AAAS members' cash orders \$5.75

Chapters

- 1) The Integument as an Organ of Protection
- 2) Circulation and Vascular Reaction
- 3) Sebaceous Gland Secretion
- 4) Pathogenetic Factors in Pre-malignant Conditions and Malignancies of the Skin

HERE'S A QUALITY STUDENT MICROSCOPE AT A BUDGET PRICE!

Although budget priced, the UNITRON Model MUS is definitely not just another student microscope. It includes these significant features often lacking in much more costly student models:

- NOT JUST a disc diaphragm... but an iris diaphragm for perfect control of aperture and contrast.
- NOT JUST a single focusing control... but both coarse and fine.
- NOT JUST a mirror... but a 0.65N.A. condenser for optimum illumination and resolution.
- NOT JUST two objectives... but three: achromatic 5X, 10X, 40X.
- NOT JUST an ordinary eyepiece... but a coated 10X Wide Field for large, flat fields.
- PLUS THESE SPECIAL FEATURES... larger stage projects beyond objective preventing damage to objectives and nosepiece. Automatic stop for fast focusing and to prevent breakage of specimen slides and optics. Durable, sturdy — withstands the use and abuse of classroom and laboratory.

Price: \$75
Only

(\$67.50 each in lots 5-10)

salaries for electronics personnel are set at the level of the local radio-TV repair man—usually less than a recent engineering graduate receives. If one wishes to attract a man with several years' experience who can bring valuable, up-to-date techniques into the hospital, one must offer a professional salary.

I feel that most engineers interested in a career as a specialist in medical instrumentation will be research-type men who will want to conduct their own research programs in addition to tackling measurement problems for physicians. Consequently, a second big question is raised: Is the engineer to be a professional staff or faculty member or just a technician? Few capable, experienced engineers will accept the latter position.

It is obvious that there are few engineers with the background to make medical judgments; however, a basic problem of instrumentation is that of finding how to obtain significant measurements. We already have too many gadgets produced by well-meaning engineers who don't know the medical problems, or by medical personnel who asked for a device but did not authorize an engineering study of the over-all measurement problem.

No real advances in medical instrumentation will be possible until both physicians and engineers consider each other specialists and are willing to work together on a professional level. It seems apparent that either of Holaday's solutions will require a re-education of both physicians and engineers.

FRED R. SIAS, JR.

Biophysics Department,
Johns Hopkins University,
Baltimore, Maryland

Sias is undoubtedly correct in his conclusion that both physicians and engineers will need training in the other's art before they are able to work together effectively.

Programs to indoctrinate engineers in biomedical areas are beginning to appear. It is true that the emphasis is toward research rather than applied instrumentation, and toward biophysics and bionics (the application of life processes to the solution of engineering problems) rather than medical engineering. Efforts in these areas should, nevertheless, generate mutual respect and, in the course of time, solutions to more immediately practical problems.

Those who have the greatest stake in medical instrumentation might give some thought to helping. Physicians

and hospital administrators could profitably make space for engineers to work in their laboratories. Instrument companies would be well advised to remove their development engineers from factory drafting boards, where the engineers continue to make conceptual mistakes in designing instruments for use in patient care, and accept opportunities to place these engineers in hospitals where the latter can witness the causes of earlier failures and participate in field trails of new attempts.

Selling Methods

Out of profound respect for *Science* and its readers, many of whom are also contributors and advisers to *Encyclopaedia Britannica*, I am compelled to comment on your editorial "The company they keep" [*Science* 134, 75 (1961)].

The editorial gives the strong—but erroneous—impression that a recent Federal Trade Commission order affecting *Encyclopaedia Britannica* deals with current selling methods. This is not true.

The original action by the FTC on which the citation was based was taken in May 1958 and involved complaints received by the FTC prior to that time.

Our salesmen have always been instructed, under penalty of immediate discharge, not to use the kind of irregular sales presentation that led to the FTC complaints. As soon as these individual complaints were brought to our attention, we took immediate steps to insure against their recurrence.

HARRY E. HOUGHTON

Encyclopaedia Britannica,
Chicago, Illinois

Here is the sequence of Federal Trade Commission documents on which my editorial on the *Encyclopaedia Britannica*, Inc., was based: (i) a "Complaint," filed 5 May 1958, serving notice to the Britannica company to appear at FTC hearings; (ii) an "Initial Decision," filed 30 August 1960, ordering the company to "cease and desist" from certain sales practices; and (iii) a "Final Order," filed 16 June 1961, ordering the company to "cease and desist" from certain sales practices, following the company's appeal of the initial decision.—J.T.
