

SCIENCE

29 December 1961

Vol. 134, No. 3496

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

Index Issue

A basic formula from Information Theory . . . provides a measure of the amount of information in a particular type of message, such as TV . . . helps determine the frequency bandwidth, for example, required to transmit the messages. Information Theory, pioneered at Bell Laboratories, guides the search for better communications systems.

DISCOVERY AT BELL TELEPHONE LABORATORIES

New knowledge comes in many forms. Sometimes it comes in a mathematical formula. Usually it comes after much thought and experiment and the fruitful interaction of different minds and abilities. Most often, too, a particular discovery is small. But many small discoveries have a way of leading to big advances at Bell Laboratories—advances like the transistor . . . or, more recently, the gaseous optical maser, forerunner of communications at optical frequencies. Opportunities for discovery are enhanced by the abilities of the scientists and engineers and the range of the facilities at Bell Laboratories, *world center of communications research and development.*

Bandages can be fun... they must be sterile

CES CONTRACT STERILIZATION will sterilize your product for you—permitting market-testing of new products without immediate equipment purchase.

CES PROCESS DEVELOPMENT will research and "pilot test" your production process for you, for best integration of sterilization.

Tommy is having a ball. But, while these bandages may make amusing playthings, their real purpose requires absolute sealed-in sterility. That's where Castle Engineered Sterilization, or "CES," comes in.

CES research provides the know-how and equipment to sterilize a thousand and one such hard-to-process items—from adhesives to photographic film. All sterilization is its province—the product, package, packaged product, selection and operation of equipment, and the handling, storage and shipment of sterile supplies.

Whatever your problem, if it involves sterilization, you can count on Castle Engineered Sterilization for the answers.

WRITE today for literature. Initial CES research and planning are without cost.

Research and Education**

KOPITO FURNACE, TF-1

Baird-Atomic's Kopito Furnace is a genuine contribution to scientific education, increasing the opportunity of high schools and colleges to extend and intensify their teaching programs in physics, chemistry, metallurgy, and ceramics.

No other furnace offers all the features of the Kopito Furnace, which is priced within the reach of almost every high school, college, and small experimental laboratory. For complete information write today for your copy of new brochure.

HIGH TEMPERATURES — Melts steel, asbestos, firebrick, tungsten.

INSTANT HEATING — Time cycle takes less than one minute.

COMPLETE VISIBILITY — Permits wide angle view of heating area.

LOW COST — Realistically priced to fit most school and laboratory budgets.

SIMPLE TO OPERATE — Single control regulates entire operating cycle.

RAPID RECOVERY — Ready to handle and store two minutes after shutdown.

WIDE RANGE OF TEACHING APPLICATIONS — Facilitates teaching and learning in the physical sciences.

COMPREHENSIVE TEACHING MANUAL — Manual containing more than 50 different experiments accompanies each Furnace.

Engineers and scientists: Investigate challenging opportunities with B/A. Write Industrial Relations Director. An equal opportunity employer.

Cover	Self-portrait of rare jellyfish (<i>Solmissus incisa</i>) taken at a depth of 1000 meters off George's Bank during studies of bioluminescence in the sea. When this 12-centimeter medusa drifted into the range of the camera (designed by Breslau and Edgerton), its luminescence was picked up by a phototube, which triggered an electronic flash to take the picture. The 2-centimeter watch gives both scale and the exact moment of exposure. [George L. Clarke, Harvard University and Woods Hole Oceanographic Institution]	

A Versatile New Van de Graaff®

A new Van de Graaff accelerator has appeared on the scene. It did not spring full-blown from the brow of an inspired design engineer and, in fact, bears a remarkable resemblance to its predecessors. It evolved rather from both an inspired customer's need and improved state of the art. The KN-4000, at 4 Mev, does fill in a gap in the voltage range of standard equipment. It offers great versatility of use, low installation cost, and delivers a very respectable 400 μ a of current at rated voltage. A convertible machine, it will also accelerate a full milliampere of electrons (4 kilowatts).

In addition to offering "beam purity" and precision, with adequate energy for a fundamental research program, its output is high enough to permit a variety of analytical and engineering uses. Neutron production would be 2×10^{12} n/sec. from the prolific Be⁹ (d,n) B¹⁰ reaction. Nanosecond pulsing is available. By "beam purity" we mean that accelerated particles are monoergic to within 100 electron volts. Electronically regulated beam stability is better than one part in several thousand. Beam

Terminal and accelerating section of the KN-4000 Van de Graaff with pressure tank removed.

Precision 90° analyzing and stabilizing system.

Short-lived radioisotope production and neutron activation, radiation effects and solid state work, radiobiology, energy level determinations, and (with conversion) massive-dose studies, catalysis and polymerization are a few of the possible areas of use. An English producer of medical supplies will use the 4 kw electron output for sterilizing his product in bulk quantities. A U.S. university will use KN-4000 as a central tool in neutron physics.

In short, with KN-4000 in your laboratory, your research program can be diverse, yet of the highest caliber. This machine will both attract and utilize top scientific and engineering personnel.

The Twelve-Pound Book

When this number of *Science* is published we will have barely room enough in our binder for volume 134 (July to December) to squeeze it in. Last year we had the same problem, so we enlarged the binders to take care of the expected growth. But we are at the end of that road, for larger binders than we used this year are not available. Even if they were, we would hesitate to use them, since the current volume and its binder will make an unwieldy twelve-pound book. We have adopted an obvious expedient: in 1962 we will publish four instead of two volumes.

For *Science*, the last few years have been notable for growth in circulation as well as in physical size. Both phenomena are in part attributable to the combination of the *Scientific Monthly* with *Science* in January 1958. It is instructive to compare *Science* in the year now ending with *Science* in 1957, the year before the combination. The following increases have occurred: circulation, from 38,000 to 71,000 (87 percent); number of editorial pages, from 1836 to 2502 (36 percent); number of advertising pages (in the face of annual increases in advertising rates), from 896 to 1686 (88 percent); gross advertising revenue, from \$264,000 to about \$800,000 (230 percent); total number of pages, from 2732 to 4188 (57 percent). Two-thirds of the increase in the number of editorial pages is attributable to the greater space devoted to leading articles, which went up in number from 101 in 1957 to 134 in 1961 and in number of pages from 449 to 811 (81 percent), and to letters, which went from 15 to 94 pages.

If we focus our attention on the differences between 1961 and 1960, we find that both circulation and advertising volume have climbed at a rapid rate: circulation went from 63,000 to 71,000 (13 percent); advertising pages from 1403 to 1686 (20 percent); and total pages from 3842 to 4188 (9 percent).

The growth in circulation is gratifying, but the growth in size gives us concern. How big should the weekly issues become? Our staff thinks that we have approached what should be our limit in those issues that once a month carry the customer's service or "bingo" card so dear to advertisers. Accordingly, we plan two steps. For one thing, as soon as the machinery for processing returns can be set up, we shall put "bingo" coupons in the 40 issues that do not contain the cards. If readers will use the coupons, advertisers may be more willing to use the smaller issues and thus reduce the peak loads. Secondly, we have put an upper limit on the amount of advertising that may appear in any number except the *Instrument Issue*.

As advertising increases, so should the amount of editorial material. We think it desirable that the editorial material should make up not less than about 42 percent of the total pages in any issue. Thus, if advertising should continue to increase, despite the rise in rates which takes effect next month, *Science* would continue to grow at a rate of about two pages of text for each additional three pages of advertising accepted.

We hope that the steps we plan to take will result in issues of more equal size and that at some not too distant time our annual growth in size will become asymptotic. So much for the mechanical problems we can foresee. They could be worse.—G.DuS.

Bausch & Lomb takes the blind

NEW

BAUSCH & LOMB

DYNAZOOM*

LABORATORY MICROSCOPES

See the advantage of optimum magnification. The revolutionary new B&L MicroZoom* optical system that makes "step magnification" obsolete. Now you can study and photograph specimens at the *ideal* magnification for all detail of every specimen from 17.5X to 1940X!

And you'll *see better* than ever... new high resolution 1.30 N.A. objective... new 1.30 N.A. condensers... new Hi-Intensity illuminator (10 to 20 times brighter than any other).

You'll enjoy more convenience, greater comfort... concentric coarse and fine focusing controls, concentric stage controls, all in low, hands-at-rest position.

And how's this for combining flexibility with economy? Choose any of 6 microscope bodies—they all fit interchangeably in the basic stand, and are all rotatable through 360°.

*Trademarks, Bausch & Lomb

BAUSCH & LOMB

SINCE  1853

Same price range as before... but more important, you can have complete reliance in its 100% American manufacture to the world's highest standard—plus the whole-hearted support of America's most dependable scientific instrument dealers.

Find out more; just mail the coupon. Then order fast to avoid delay.

GRASSLANDS

Editor: Howard B. Sprague 1959

6" x 9", 424 pp., 37 illus., index, cloth.
Price \$9.00, AAAS members' cash orders \$8.00. AAAS Symposium Volume No. 53.

This volume is intended as a review of knowledge on many aspects of grasslands resources. The 44 authors were selected by their own professional colleagues as being particularly competent to present the respective subjects. Thirty-seven papers are arranged under these chapter headings:

1. Sciences in Support of Grassland Research
2. Forage Production in Temperate Humid Regions
3. Engineering Aspects of Grassland Agriculture
4. Forage Utilization and Related Animal Nutrition Problems
5. Evaluation of the Nutritive Significance of Forages
6. Grassland Climatology
7. Ecology of Grasslands
8. Range Management

Meetings

The Nature of the Real

A series of conferences on the nature of the real was held at Marquette University, Milwaukee, Wisconsin, from 12 to 15 June 1961.

Of the six principal speakers, three were physicists and three were philosophers. The physicist speakers were Eugene P. Wigner (Princeton University), Alfred Landé (Ohio State University), and Robert Maurer (University of Illinois). The philosopher speakers were R. J. Henle (St. Louis University), Paul Weiss (Yale University), and Charles DeKoninck (Laval University). Three other philosophers formally commented on the papers of the three physicists and three other physicists commented on the papers of the philosophers. The philosopher commentators were G. Klubertanz (St. Louis University), Richard Blackwell (John Carroll University), and James Weisheipl (Dominican House of Studies). The physicist commentators were Max Dresden (State University of Iowa), Albert Rose (RCA Laboratories), and L. W. Friedrich (Marquette University).

It was pointed out by the physicists that the reason why the problems of epistemology and ontology are of increased interest to the contemporary physicist is that he has found it impossible to give a satisfactory description of atomic phenomena without explicit reference to consciousness. It was suggested by one physicist that there are two kinds of reality: that of my consciousness, which is absolute, and that of other objects, which is relative and ranges over a wide spectrum.

Causality was discussed by both the philosophers and the physicists. Attempts to hold out for cause-effect continuity in all of reality falter when one encounters quantum mechanical interpretations of atomic phenomena. Two of the physicists expressed the fear that their colleagues have become so enthralled by the success of the mental constructs, or concepts, used by physicists that they unwittingly fail to distinguish purely mental concepts from the real world. As an example of this, reference was made to Bohr, who was accused of transferring the uncertainty of prediction expressed by the Heisenberg uncertainty principle into an indeterminacy of being itself, thereby treating the analysis of concepts as

though such analysis were equivalent to an examination of primary data.

One of the philosophers explained that we discover physical reality through a primary form of human experience which is at the same time the primary content of human consciousness. This experience is a concrete encounter with a complex object, or set of objects. It is a knowledge encounter as well as an encounter with objects. The physical reality which we discover through continuing encounters is not only a world of existing extended beings; it is a world of movement and change, of interaction and interrelation. Insightful reflection and inference bring us to see that the existence and activity of the physical world must be understood within a framework of causes and of causal explanation.

Another of the philosophers pointed out that scientific study gives us a more objective, precise, and systematic grasp of reality than is obtainable by the commonsense man. Nevertheless, it does not give us the ultimately real. Grasp of ultimate reality is possible "only through speculation, in a dialectically sustained systematic account of the content of common experience, distilled and generalized."

It was agreed by most of the participants that, although the vast array of reproducible experiments demonstrates that there are an extraordinarily large number of phenomena that are causally related, yet the causal principal is not valid for all known sequences of phenomena. Some observables remain erratic and unpredictable despite the refined techniques used to measure them. Physicists do not attribute this to the limitations of their techniques. That leaves little choice but to accept, as an ultimate fact of the real world, the absence of causal relation linking these phenomena.

Not much light was cast during these conferences on how the acausal, relatively random, behavior at the atomic level can be the basis for ordered causal behavior at the macroscopic level. It is difficult to determine where the transition (if it can be called that) occurs between random, acausal behavior and ordered behavior, or between a random distribution of elementary particles and an ordered structure of which those same particles become the ultimate components.

The purpose of the conferences was simple and fundamental. They were held to attempt the building of a bridge

UNITRON'S Model MSA
makes teaching easier
... learning faster!

Here is a teaching microscope with built-in features to aid the instructor and student, yet priced for school budgets.

- Comfortably inclined eyepiece rotates 360° permitting two persons to share the same instrument, make comparisons, discuss results
- High intensity illuminating system with built-in transformer base
- Substage condenser with aperture iris diaphragm assures correct and brilliant illumination at all powers
- Low positioned coarse and fine focusing controls with protective stops to prevent damage to objectives or slides
- Large stage projects beyond objective preventing accidental damage
- Three parfocal achromatic objectives 4X, 10X, 40X of professional quality with full numerical aperture and resolving power ... three eyepieces 5X, 10X, 15X ... gives magnifications from 20X to 600X
- 10X widefield eyepiece now optionally available ... gives large, flat field of view and desirable magnification

of understanding between philosophers and physicists. Until the two groups agree on the meanings of words they use in common and until they accept the scope of each other's valid areas of interest as well as understand each other's limitations, meaningful dialogue between the two is well-nigh impossible.

Recurring efforts were made on the part of many of the participants to outline the "levels of reality" within the entire spectrum of reality, from the most really real down to the most tenuously real. These conferences pointed up the problems involved in such attempts. Much needs to be done before these problems will be solved.

Both the philosophers and the physicists agreed that they must learn much from each other before a good philosophy of physics can be written, if indeed that will ever be possible.

A total of 121 persons attended the conferences. Publication of the proceedings of these conferences is planned.

25-1. Pan American Assoc. of Otorhino-Laryngology and Broncho-Esophagology, Caracas, Venezuela. (C. M. Norris, 3401 N. Broad St., Philadelphia 40, Pa.)

(See 22 December issue for comprehensive list)

New

Nalgene®

5-gallon

Solution

Bottle

one-fifth the weight of glass . . . and infinitely safer!

Nalgene Solution Bottles stand repeated autoclaving

SAFEST EVERY WAY! Blow-molded of virgin polypropylene—all the corrosion resistance of glass, in the most punishment-proof bottle you've ever seen! Drop it empty: it just bounces. Drop it full: it may crack, can't shatter.

Easily cleaned—can't sustain bacterial growth—*withstands repeated autoclaving*. Tooled to fit the standard No. 12 rubber stopper.

EASIEST TO HANDLE! Weighs only 2½ pounds (versus 11 pounds for glass). And wet or dry, it never gets slippery like glass. Next time you order, specify Nalgene—and see how much easier these new solution bottles are on you . . . and on your budget. Just check with your laboratory supply dealer.

WRITE Dept. 2112A for new catalog of the complete line of Nalgene laboratory ware.

Nalge makes them unbreakable and keeps making them better!
