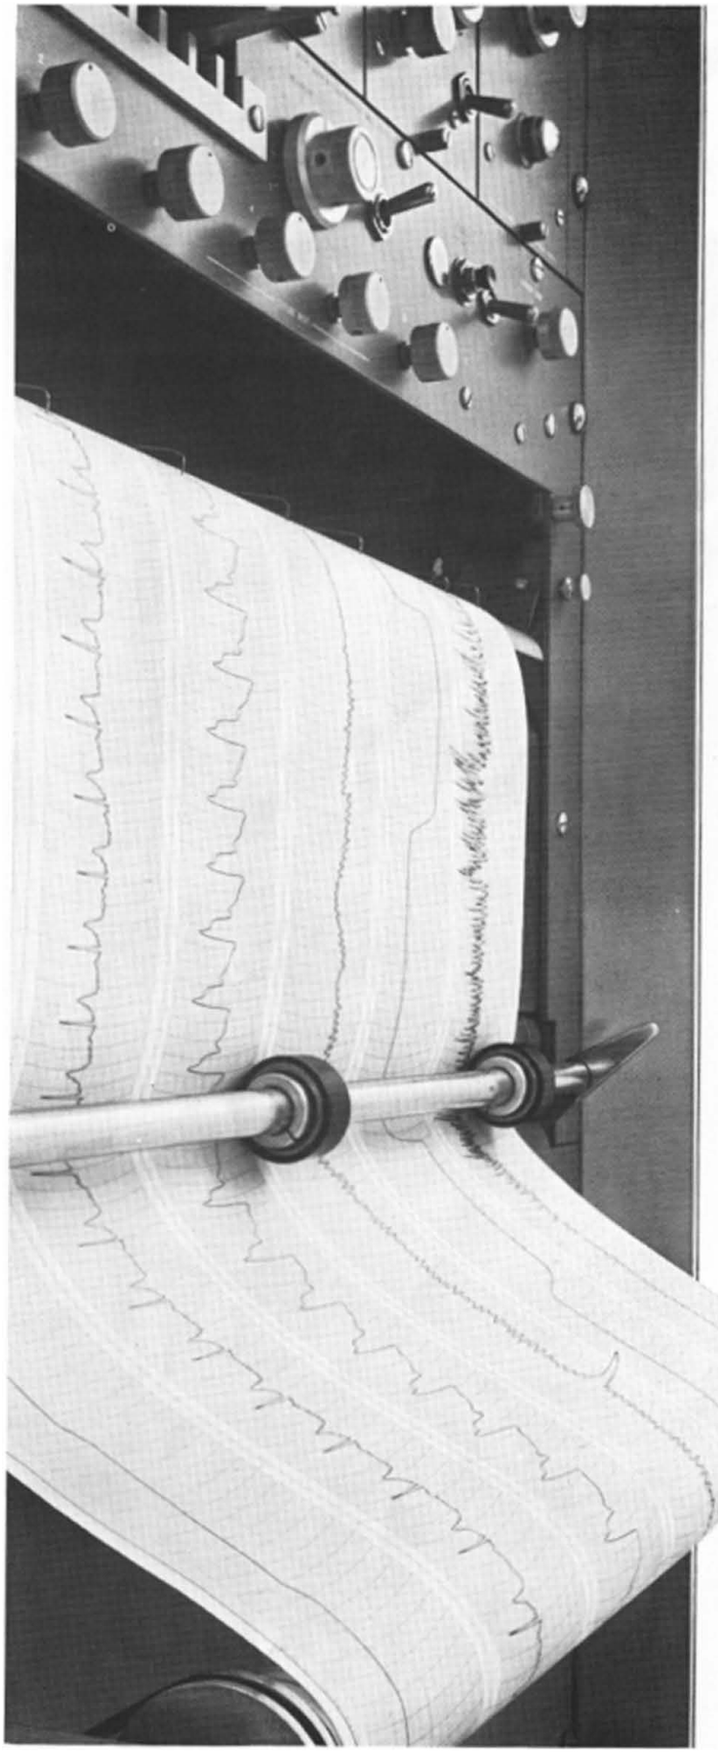
NOT ALL CLOUDS ARE FOR RAIN



RECOGNIZE THESE TRACES?

They're systolic blood pressure, EKG, carotid pulse wave, EEG, expired CO_2, and integrated EMG – being recorded with the exceptional fidelity inherent in Offner Dynographs®. The superbly designed circuits of these direct-writing oscillographs are fully transistorized, giving reliability, instant warm-up, and performance second to none. Frequency response: flat to 200 cps. Sensitivity: one microvolt per millimeter deflection.

Other functions can be recorded with equal ease using economical plug-in couplers in virtually any recording arrangement wanted. Eight channels are standard, 2 to 24 optional. Choice of roll or folded paper, and ink, heat or electric recording complete the picture.

Dynograph brochures are available from Spinco Division, Beckman Instruments, Inc., Palo Alto, California – ask for Data File OR-5.

OFFNER: *now sold and serviced through Beckman worldwide facilities*

GENERAL BIOLOGY

Romer— New (3rd) Edition

The Vertebrate Body

This popular text combines the study of the form and function of the vertebrate body, carefully interwoven with embryological, histological, paleontological, and evolutionary material. Avoiding overemphasis on the human structure, Dr. Romer achieves truly comparative coverage. He considers function in order to help the student understand the relationships between the various systems within the animal, and between the animal and its environment. While retaining the clarity and excellent organization that characterized earlier editions, the author has brought the content completely up to date in this *New (3rd) Edition.* An entirely new chapter on the endocrines has been added; illustrations have been replaced, relabelled, or revised, and color has been added to increase their impact. Three Appendices present: A Synoptic Classification of Chordates; Scientific Terminology; References.

By ALFRED SHERWOOD ROMER, Alexander Agassiz Professor of Zoology and Director, Museum of Comparative Zoology, Harvard University. 627 pages, 6" x 9¼", 407 illustrations. $8.00.
New (3rd) Edition—Just Published

Romer— New (3rd) Edition

A Shorter Version of The Vertebrate Body

This text was designed expressly for the short course in comparative anatomy. It represents a highly discriminating distillation of the larger work above. All the major portions have been retained, rewritten to preserve clarity and continuity, while lesser details have been omitted. The initial portion of the original work (material on the vertebrate body plan, natural history topics, discussions on family trees)—the chapters on cells and tissues—the three appendices—all 407 precisely labelled illustrations—have been reproduced intact.

By ALFRED SHERWOOD ROMER, Alexander Agassiz Professor of Zoology and Director. Museum of Comparative Zoology, Harvard University. 478 pages, 6" x 9¼", 407 illustrations. $6.50.
New (3rd) Edition—Just Published

Villee— New (4th) Edition

Biology

Designed for the college course, this text was organized for the instructor, and written for the student. It presents a total, cohesive picture of biology, and includes dozens of fascinating and illustrative discussions on topics such as photo-synthesis, chemistry of vision, biological clocks in plants, ascent of sap, conservation, and marine light zones. Beginning with scientific methods of investigation, the author proceeds to cellular function, body function, and concludes with ecology. Included with many other revisions in this *New (4th) Edition* are: new emphasis on biochemical aspects (especially in metabolism and nutrition)—a completely rewritten section on genetics—renewed attention to the cell and its components—new and larger illustrations, especially in the completely new section on the anatomy of the frog.

By CLAUDE A. VILLEE, Harvard University. 625 pages, 7¼" x 10¼", with 397 illustrations. $7.50. *New (4th) Edition—Just Published*

Schonberger— New!

Laboratory Manual of General Biology

A perfect companion to Villee's text above, this new manual is readily adapted to any general biology text or method of teaching. Every experiment has been tested in actual classroom work, with both biology majors and non-majors. Student instructions are so explicit that little or no explanation is necessary. These original exercises were developed especially for this book. They deal with cells, structure and activities of individual organisms, heredity, evolution, tissue, enzymes, reproduction, development, taxonomy of algae, ferns, fungi, protozoa, anthropod line and chordate line, etc.

By CLINTON F. SCHONBERGER, Assistant Professor of Biology and Chairman of the Department of Biology, San Bernardino Valley College, San Bernardino, California, 357 pages, 8½" x 11", illustrated. $4.50.

B/A All-Dielectric INTERFERENCE FILTERS

Baird-Atomic announces the introduction of their radically improved Ultra-violet Filters and all-dielectric Visible Spectrum Interference Filters.

The new 'block shape' ⎍ passband in the Visible Spectrum Filters enables the user to obtain the greatest degree of spectral purity.

If the filter you require is not available in stock, normal delivery time is within thirty to thirty-five days.

Standard filter sizes are 1″ x 1″ and 2″ x 2″; other sizes and shapes are available on special order. Write for your copy of our new filter brochure.

Engineers and scientists — investigate challenging opportunities with Baird-Atomic. Write Industrial Relations Department.

Visible Spectrum

- 4000Å - 8000Å
- New block shape ⎍ passband
- Absorption filters and/or evaporated blocking components provide for maximum blocking, reduced thickness, and improved signal-to-noise ratio
- Transmission outside of passband: under 0.1%
- Half bandwidths from 4.8 Å to 1600Å
- Total transmission from fully blocked filter: up to 70%
- Blocking — complete on low side — high side blocking to at least 8000Å (Additional blocking at extra cost)

Ultraviolet Spectrum

- 2100Å to 3400Å and 3900Å to 3999Å

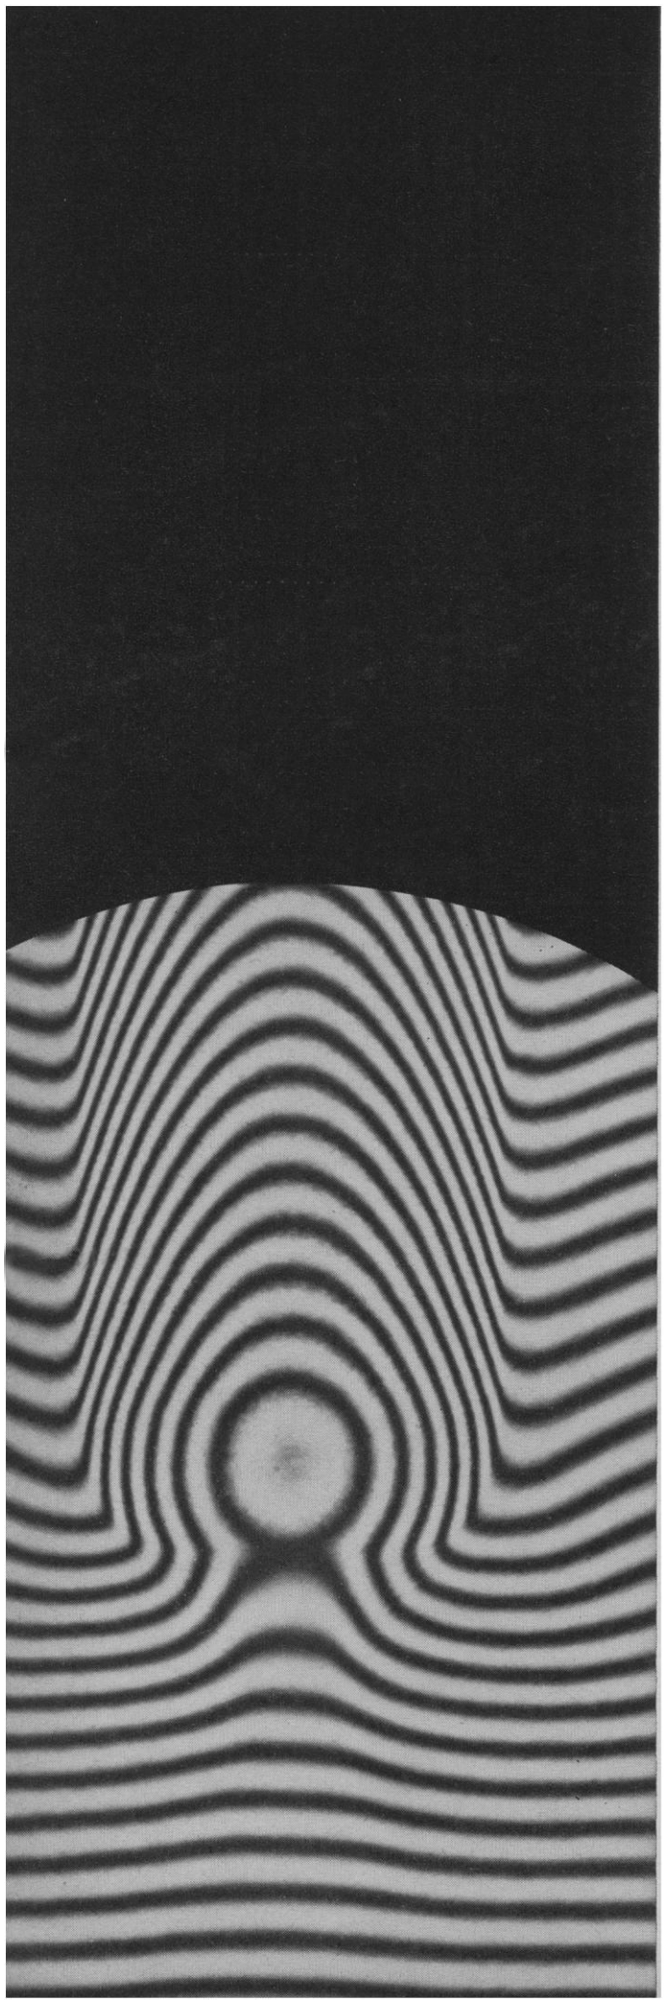
Cloud over the Magdalena Mountains (elevation 10,700 feet) 17 miles west of Socorro, New Mexico. Two factors contributed to the failure of this cloud to produce rain: (i) the air was abnormally dry, as is indicated by the weight of the cloud base above the mountain; (ii) winds aloft moved the top of the cloud toward the east, producing a shearing action that broke the alignment of the columns in the cloud. See page 407.



One of a series briefly describing GM's research in depth

When two solids touch... plastic strain or dislocations?

The engineer would talk of a plastically strained material. The solid state scientist, of dislocations occurring on the atomic level. Here at the General Motors Research Laboratories, we're interested in learning more about the mechanical nature of solids from both points of view.

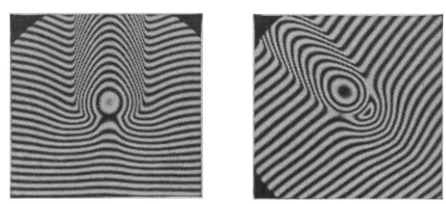
One of our current investigations into the solid state, for example, is aimed at fitting together an atomic picture of what happens when a solid is deformed by a contact force. Simple case: a sapphire ball rolling across a soft single crystal of copper.

For various directions of roll, striking differences in deformation, hardness, and rolling force have been measured and related to the crystal's atomic slip planes. Our work has progressed from this macroscopic correlation to a three-dimensional study of dislocation arrangement. Encouragingly, experimental results have agreed with theoretical predictions as to how specific crystal dislocations interact to cause work hardening—a phenomenon that sharply limits further damage to the material.

A fundamental understanding of mechanical properties may some day help man improve a number of practical contact processes . . . processes where two solids touch. Rolling. Stamping. Pressing. Wear and friction of moving parts. General Motors is seeking this understanding with research in depth.

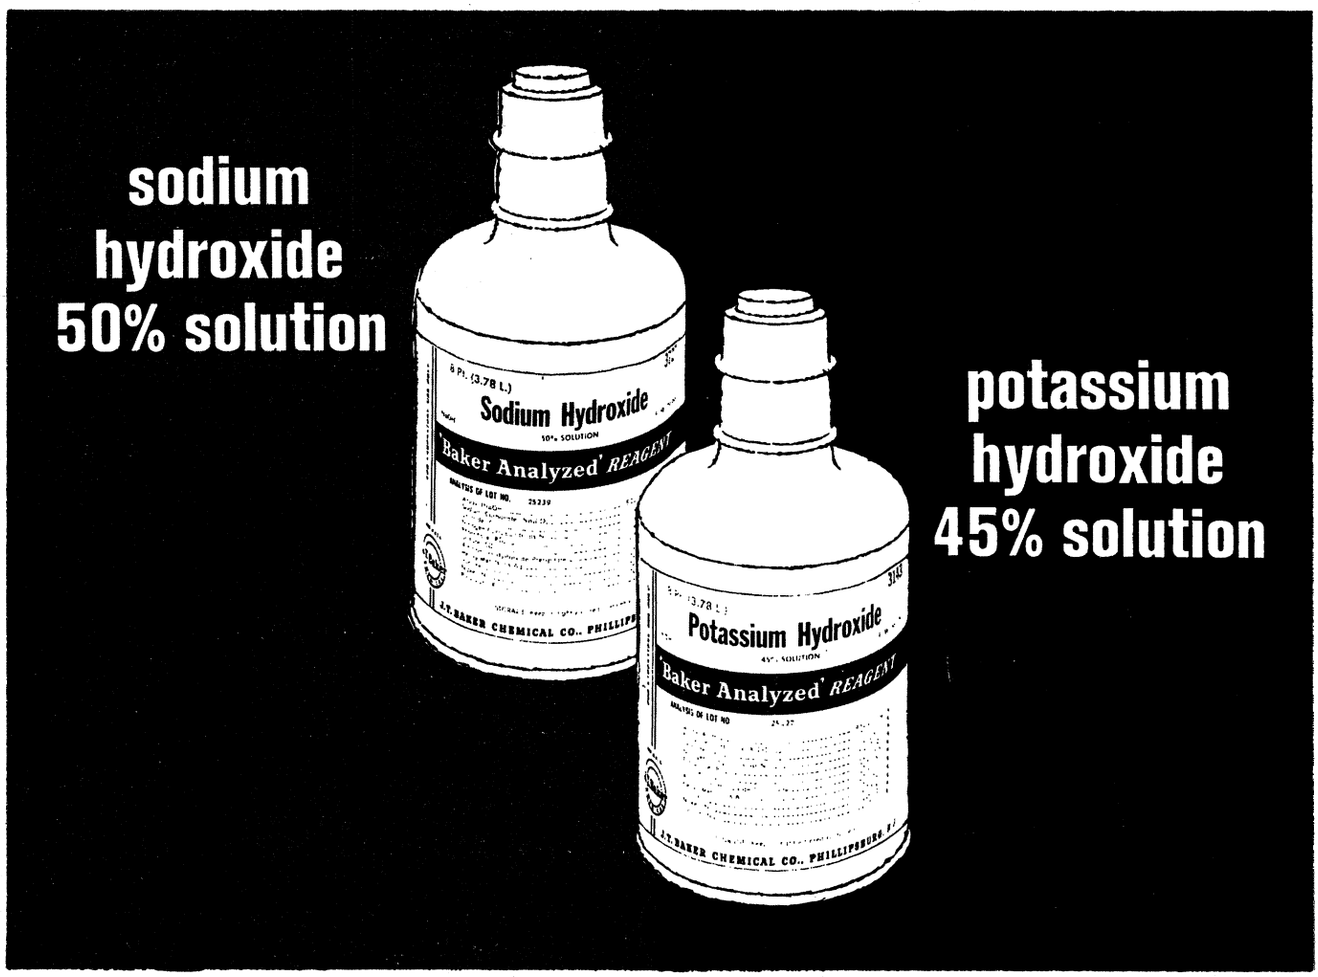
General Motors Research Laboratories

Warren, Michigan



Ball track across copper crystal is narrower, harder and has higher friction in a cube diagonal direction (right interferogram) than in a cube edge direction.

time-saving solutions



Designed for busy chemists, these two 'Baker Analyzed' Reagents are offered in easy-to-use **solution** form. You eliminate dissolving time and can quickly prepare accurate shelf and volumetric solutions by dilution.

Both J. T. Baker Solutions are labeled with the Actual Lot Analysis and Actual Lot Assay. Purity is precisely defined.

Your favorite Laboratory Supply House can supply both time-saving Solutions in 1-pint and 8-pint polyethylene bottles, and also the Sodium Hydroxide 50% Solution in a 60-lb. container. J. T. Baker Chemical Co., Phillipsburg, N. J.

J.T. BAKER LABORATORY CHEMICALS

PHILADELPHIA • 129th AAAS

Order Your General Program

It provides complete, detailed information about all the sessions and symposia scheduled, the Annual Exposition of Science and Industry, and the Science Theatre.

Program Highlights

Moving Frontiers of Science H. E. Newell on space science, S. B. Hendricks on biological timing mechanisms, S. Brenner on perspectives in molecular biology, W. O. Baker on industrial research.

Interdisciplinary Symposia AAAS day: Dynamics of planetary atmospheres, the spread of technical knowledge as an instrument of economic development, biochemistry of genetic transcription.

Special Sessions AAAS Presidential Address by Thomas Park on "Beetles, Competition, and Population"; the George Sarton Memorial Lecture by Gerald Holton; the Joint Address of Sigma Xi and Phi Beta Kappa by Loren C. Eiseley on "Man: The Lethal Factor"; the AAAS Distinguished Lecture, the Tau Beta Pi address; and the National Geographic Society Illustrated Lecture.

AAAS Committees Sessions of the Cooperative Committee on the Teaching of Science and Mathematics, the Committee on Science in the Promotion of Human Welfare, and others.

Sections and Societies The 20 AAAS Sections and some 50 participating societies are scheduling specialized symposia, and many have sessions for contributed papers.

Science Theatre The latest foreign and domestic films.

Exposition The Annual Exposition of Science and Industry will be 35 percent larger than it was last year.

Advance Registration By registering in advance, you avoid delay at the Registration Center on arrival, you receive the *General Program* in time to plan your days at the meeting, and you permit your name to be posted in the Visible Directory of Registrants when the meeting opens.

Use the coupon below for advance registration or to order your advance copy of the *General Program.*

AAAS
1515 Massachusetts Ave., N.W.
Washington 5, D.C.

(Check 1a or 1b)

1a. ☐ Enclosed is $3.50 Advance Registration Fee. This brings me the **General Program** and Convention Badge.

1b. ☐ Enclosed is $2.50 for the **General Program.** (if I attend the meeting, the badge, which I need to obtain the privileges of the meeting, will cost me $1.00 more.)

2. FULL NAME (Dr., Miss, etc.) ..... (Please print or typewrite) (Last) (First) (Initial)

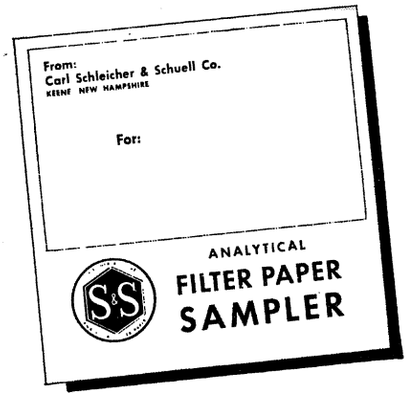
TO ANALYTICAL CHEMISTS



Try the Finest!

To acquaint you with S&S Analytical Filter Papers, we invite analytical chemists to mail the coupon below for a free sampler made up of several grades.

As an analytical chemist, you know that precise chemical analysis requires filter paper of the proper quality and density.

For those who demand only the finest working tools, S&S Filter Papers offer these advantages:

1. **Standardization,** for consistent accuracy — complete physical uniformity.
2. **Selection,** for more precise analysis — a wide range of types from which to choose.

Make your own tests! Send for your S&S Filter Paper Sampler!

S&S MEMBRANE FILTERS

S&S *Ultraflex* Membrane filters for filtration of liquids and gasses have extremely uniform micropore structure. Pore sizes of different filter types range from 5 millimicrons to about 10 microns.

Social Science Research

In a recent issue of *Science* [**136**, 509 (1962)] there appeared a joint review by Kenneth Boulding of Clarence Ayres's *Toward a Reasonable Society* and Marshall Dimock's *The New American Political Economy*. Boulding dismisses Dimock's book as a study in the pathology of rhetoric. He is somewhat kinder to Ayres, whom he classifies as the outstanding representative of the school of institutional economics. Then he goes on, "For all the enormous difference in quality in these two works . . . [each] represents, in a sense, a personal philosophy of society. . . . But [this type of intellectual activity] does not have that peculiar property of securely based information and carefully tested prediction which is the identifying mark of the scientific process." Then follows this patronizing comment: "Political Non-Science is not necessarily nonsense, though it seems to have a bias in that direction. It should not, however, be mistaken for that *political science based on quantitative data and testable theory, which is now in the making*" (italics mine).

May I remind Boulding of Aristotle's dictum that each field carries a method appropriate to the material it is examining. Paul Lazarsfeld is much more modest in his claims. He refers to the hostile outsiders who ask, "What has social research all added up to in the last fifty years? Is there any sociological finding that has not been anticipated by philosophers or novelists? The answer has to be qualified. True, it is unlikely that any surprising 'discoveries' will be made for quite some time to come."

I am certain that the work of Dimock and Ayres will survive Boulding's review. What is disturbing is the implication that the methods of the physical sciences are the sole key to unraveling the mysteries of the social disciplines. This is not an entirely new point of view. Herbert Spencer was able to gain a widespread audience for nonsense disguised as sociology by trading on the language of Darwin. Just as physics-thinking dominates our intellectual climate today so Darwinian thinking dominated the late-19th century cultural climate.

May I suggest that the social researchers who are engaged in quantitative research be somewhat less aggressive in proclaiming their virtues until they are able to come up with some insights not previously arrived at by other methods.

It is distressing that this quasi-scientific group, despite the poverty of the results thus far gleaned from their labors, demand control of all research in the social disciplines.

There is room for both traditions in our intellectual investigations. It is unfortunate that the physics-oriented group seem to have the inside track where funds from federal sources and from the private philanthropic foundations are concerned.

However, in the area of social research, despite all the financing and all the grants, we have yet to see men of the stature of Veblen or Commons or Mitchell emerge.

The whole field of social studies is in a serious state of flux. If social studies are to receive federal support, then the criterion of choice should be broader than the National Science Foundation's narrowly conceived ideas of what basic social science research is. The kind of intellectual authoritarian arrogance portrayed is doing well enough without additional federal funds to encourage it.

WILLIAM GOMBERG
Wharton School of Finance and Commerce, University of Pennsylvania, Philadelphia

Gomberg is reading things into my review which I did not say. I did not say, nor do I believe, that the methods of the physical sciences are the sole key to unraveling the mysteries of the social disciplines. I have always maintained that the methods of the humanities gave us true knowledge and important knowledge, and I have main-

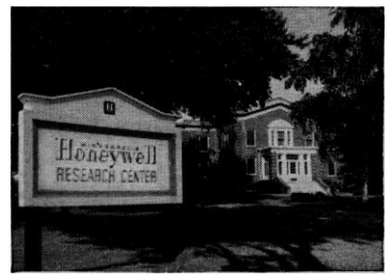
Basic Research at Honeywell
Research Center
Hopkins, Minnesota



Studies of the Visual Processes Underlying Color Perception

Precise psycho-physical measurement techniques appear to clarify conflicting theories on the color receptor system of the human eye, possibly confirming an additive four-component receptor system as underlying color and brightness perception.

Scientists have been trying to understand how the eye sees color and to duplicate this process ever since the time of Sir Isaac Newton, who proposed that there were as many neural processes as there were discriminable colors. Thomas Young in 1801 recognized that if three primary colors, when mixed in different proportions, can be made to match any color of the spectrum, then a system of three independent receptors would be adequate. Von Helmholtz amplified the Young theory by suggesting that the brightness of colors was the sum of the responses of the three classes of color receptors. This has been termed an "additive" theory.

An alternate theory is the "opponents" theory proposed by Hering and based largely on psycho-physical data. He proposed that two antagonistic (or opposed) pairs of receptor mechanisms provide "color aspect" of color vision. These pairs are blue-yellow and red-green. Brightness in this theory is independent of the color mechanism but is dependent on a third black-white process.

The conflict in theories is sharpest on two empirical questions: (1) Is yellow the combined response of the red and green mechanisms (additive) or does it have an independent response mechanism (opponents)? (2) Is brightness the summed response of the color receptors or an independent mechanism?

Honeywell psychologists are using a very sensitive technique utilizing psycho-physical responses of human subjects. By refining techniques of chromatic adaptation in combination with threshold measurement they have succeeded in isolating microstructure in the human foveal spectral sensitivity curve.

There now appears to be evidence that there are sensitivity peaks corresponding to red, yellow, green and perhaps blue. By adapting the eye to very narrow wave bands in the red, yellow and green parts of the spectrum it is possible to reduce these sensitivity peaks selectively supporting an additive theory but with at least four components.

In the Honeywell experiments, a seated subject fixates a small circle in a large surround field which carries the adaptive light. After adapting the eye to the surround field the subject fixates the small center circle where a narrow band stimulus from the various bands of the spectrum is flashed. The threshold energy for detecting this flash is measured. Measurements indicate (see fig. 1-a) that when the eye is neutrally adapted, there is a main peak in the green at 550mμ and sub maxima at 570mμ (yellow) and at 600mμ through 690mμ in the red.

When the eye is adapted to red (fig. 1-b) the red shoulder or sub maximum at 600mμ to 690mμ is greatly reduced.

When adapting the eye to yellow (fig. 1-c) the 570mμ peak is almost eliminated.

Using a green adaptation (fig. 1-d) the main peak at 550mμ appears somewhat reduced.

It is important to note that in each case the adjacent shoulder is unaffected.

These techniques demonstrate that spectral sensitivity may be a composite of several underlying chromatic mechanisms which above 500mμ have three independent components with peak sensitivities to green, yellow and red light.

Further work is underway at Honeywell's Research Center to relate these findings to brightness perception and to explore more intensely the nature of the yellow response mechanism. Of obvious interest and concern to the medical and human factors field, a deeper understanding will also make possible significant advances in the technology of color measurement leading to mechanical simulation of color reception.

If you are engaged in scientific work in color perception and wish to know more about Honeywell's research in this area, you are invited to correspond with Dr. Harry Sperling, Honeywell Research Center, Hopkins, Minnesota.

If you are interested in a career at Honeywell's Research Center and hold an advanced degree you are invited to write Dr. John Dempsey, Director of Research at this same address.

Plans for *Science*

In becoming editor of *Science* I am in the position of one who has been made custodian of a uniquely valuable property. With a circulation approaching 80,000, the journal reaches all segments of American science. Many scientists turn to it before scanning the publications of their specialties. With an excellent editorial staff and efficient printing arrangements, *Science* can provide fast publication. Thus the News and Comment section has a deadline of Tuesday; the journal is printed on Wednesday and is usually in the mail by midnight. Location of the editorial offices in Washington, together with this speed, permits effective handling of news of special import to readers.

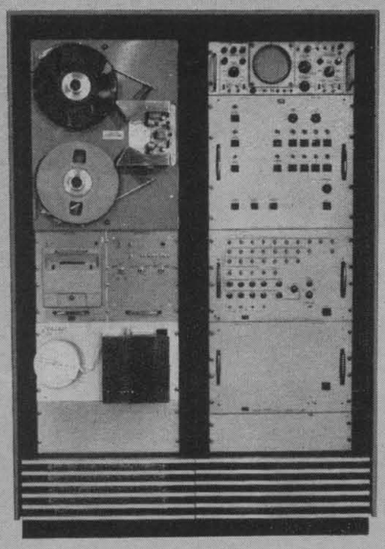
Our plans call for no drastic revision of the present content. We will build on the existing structure. This is already occurring in our Reports section, which is being expanded to achieve a balance of material from the biological and physical sciences. Biology is an exciting area these days, and we will continue to publish about the same number of reports in biology as we have heretofore. We are increasing the number of papers in the physical sciences. Simultaneously we have reduced our median publication time. This has been cut to something less than 3 months, and we expect to reduce it to 2 months. Some material appears in less than a month. In attaining this speed, quality has not been sacrificed. Indeed, the reviewing process has been reinforced and outside referees are being employed more intensively.

Another section which is being expanded is Meeting Reports, particularly reports of symposia. At a time when criticism is being directed toward large meetings, much of the important work in science is being reported in small closed gatherings. We are inviting participants or organizers of selected symposia to prepare summaries for us, and we hope thus to cover many important events.

The content of a scientific journal ordinarily is determined by the material that is passively received from authors. The editor exercises judgment by choosing from what is in hand. Such a process tends to leave content to chance, for one cannot print that which is not received. In principle, at least, the situation can be altered by supplementing the voluntary mechanisms by recruiting. For this purpose our Editorial Board has been expanded and its functions have been altered. Members' duties are to identify significant new discoveries and developments and to initiate steps leading to their disclosure in *Science*. Members are men of broad interests and wide acquaintance, and we believe their efforts will have considerable impact on the journal. Their names are listed at the left.

Most of the other features of *Science* will go on as before. Your editor has not been writing many editorials. He has opinions, some strong, many unorthodox, but he feels that he can best foster *Science* by employing his energies on technical content.

With passage of time and further consideration and consultation, additional plans and other attitudes will doubtless evolve. As of the moment we are pleased with the evidence of progress, and especially with the cooperative attitude of all who have been asked to help.—P.H.A.



New approaches to problems in technical measurement

Nuclear structure studies can now be made in greater detail than ever, by physicists using the TMC 4096-channel time-of-flight analyzer. As the target material is bombarded by neutrons, nuclear particles may be displaced and scattered hither and yon. The time-of-flight analyzer detects these particles, measures their flight time from target to detector and stores the information in an appropriate channel of the unit's computer memory. With a capacity of 4096 channels* each storing 10^5 "bits" of data and ability to record flight times in the nanosecond range, this new analyzer provides resolution that permits more critical research analyses than ever before. In addition, the instrument can be set up to make pulse height analyses of gamma radiation simultaneously with time-of-flight studies.

This is one of many TMC innovations in nuclear physics research instrumentation. And TMC subsidiaries are equally important in their fields . . . Mnemotron Corporation in medical and industrial research; Telemetrics, Inc. in advanced ground station telemetry. For details on TMC capabilities in solving your technical measurement problems, write Technical Measurement Corp., 441 Washington Avenue, North Haven, Connecticut.

*also available with 16384 channel capacity.

NEW FOR INSTRUMENTATION

HONEYWELL 8100

PORTABLE TAPE RECORDER

HONEYWELL 8100

PORTABLE OR RACK MOUNTED
One man can carry the 75 lb. 8100 in its functional case. For rack mounting, case slips off, chassis fits standard rack (19″).

FOUR SPEEDS
One switch controls selection of 30 ips, 15 ips, 3¾ ips, or 1⅞ ips, and automatically switches center frequencies.

LIGHTED PUSH BUTTONS
Honeywell MICRO SWITCH precision switches are backlighted to quickly indicate control mode in use.

SIMPLIFIED TAPE TENSIONING
Constant current divider to supply and take-up printed-circuit motors maintains constant tape tension without follower arms, potentiometers, or servos.

EXTREMELY SHORT TAPE PATH
Flutter is minimized.

HIGH RELIABILITY HEADS
Manufactured by Honeywell to exact standards for the 8100.

DC CAPSTAN MOTOR
Tape capstan motor with printed-circuit armature controlled by tone wheel and phase comparison servo for speed accuracy.

END-OF-TAPE SENSING
Photocell control stops all functions at end of tape, upon tape breakage, or at intermediate points as desired.

EXTERNAL MONITORING
Conveniently located terminals provide plug-in monitoring from any distance.

MONITOR SCOPE
Optional scope for monitoring input or output.

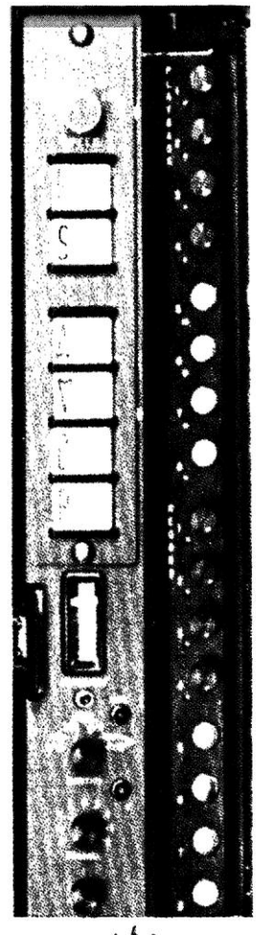
A TRULY PORTABLE INSTRUMENTATION RECORDER

DC TO 10,000 CYCLES ✲ AND REASONABLY PRICED

If you have been denying yourself the benefits of tape instrumentation because of size, weight, or price considerations, the compact, versatile Honeywell 8100 warrants your serious attention. Several new concepts in recorder design make it the most advanced portable instrument in its price range ($5,900 to $11,300, depending upon configuration).

Automatic Switching

The 8100 is the only portable recorder with automatic switching of all recording oscillators at all 4 speeds, eliminating manual change of plug-in cards. Automatic switching of any 2 of 4 playback speeds.

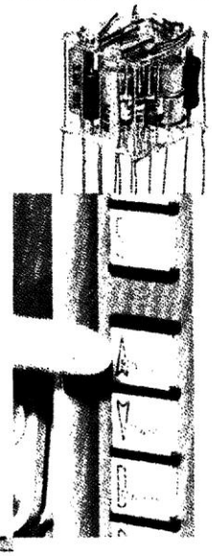


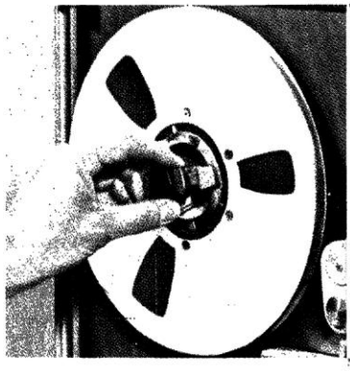
Built-in Calibration

The 8100 is the only portable recorder which accomplishes all necessary calibration with integral controls; no other calibrating instruments are required.

Welded Modules

The Honeywell 8100 is the first recorder to use welded modules and solid state electronics throughout.





NEW IDEA IN HUBS

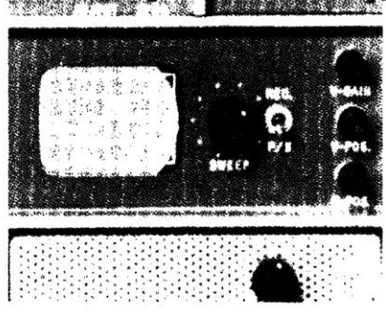
The unique Honeywell hold-down hubs make possible one-hand reel locking and unlocking.

OPERATOR CONVENIENCE

Control of the 8100 has been engineered for maximum usefulness with speed and versatility.

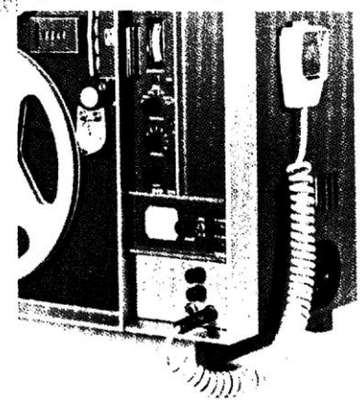
MONITOR SCOPE

Consistent with operator-designed features, the optional scope is a part of control panel.



VOICE CHANNEL

Optional voice channel uses outside track, has integral speaker and microphone.



SPECIFICATIONS AND SYSTEMS SUGGESTIONS ON NEXT PAGE

Honeywell 8100 Specifications

WEIGHT: 64 to 82 lbs., depending upon configuration. Average weight (IRIG) is 75 lbs.

DIMENSIONS: In portable case: 19⅜" x 24" x 10"; chassis for rack mounting: 19" x 22¾" x 10".

POWER REQUIREMENTS: 110V or 220V AC ± 10%. 50-400 cps; 40 watts maximum standby, 175 maximum operate (8 channel) or plus-minus 12V DC ± 10%.

REEL SIZE: 10½" x ¼" or ½"; NAB Hub.

TAPE SPEEDS: 30, 15, 3¾, and 1⅞ inches per second.

FIELD ENVIRONMENT: Although designed for laboratory use, the 8100 will withstand the rigors of field use if properly handled. Provision for standard operation from two 12V DC storage batteries.

MONITOR SCOPE: Optional oscilloscope integral with cabinet; local or remote monitoring via terminals provided.

FRONT DOOR: Tape reels, tape drive and heads protected by Plexiglass door.

FREQUENCY RESPONSE, DC TO:

10KC at 30 ips	1.25 KC at 3¾ ips
5KC at 15 ips	0.625 KC at 1⅞ ips

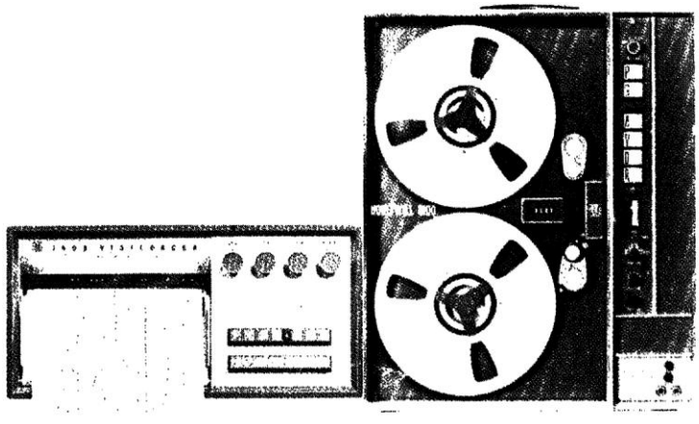
CONFIGURATIONS:

Model	*Tape Width*	*Maximum Number of Channels*		
8104	¼"	4 FM Data	1 Voice	1 Compensation
8105*	½"	4 FM Data	1 Voice	1 Compensation
8107	½"	6 FM Data *or*	1 Voice	1 Compensation
IRIG		7 FM Data	1 Voice	.....
8108	½"	8 FM Data	1 Voice	1 Compensation

*Field expandable to Model 8108.

Choice of Playback Configurations for all Models:
1. One uncompensated monitor playback channel only.
2. One compensated playback channel and channel selector
3. Full complement of compensated playback channels.

USE THE HONEYWELL 8100 WITH YOUR VISICORDER FOR EXCEPTIONAL DATA ACQUISITION CAPACITY



TYPICAL BENCH SYSTEM. The 1508 Visicorder oscillograph makes a perfect companion for the 8100. Data up to 10KC, recorded on the 8100, may be read out on the Visicorder without additional amplifiers. Both units are portable, hook-up is simple and quick. A typical 4-channel 8100-1508 system would price at less than $9,000.

ANOTHER MEMBER OF THE HONEYWELL FAMILY OF DATA ACQUISITION SYSTEMS

THE LAR 7400 MAGNETIC TAPE SYSTEM

FEATURES:

VERSATILITY OF FM data handling.

EXTENDED RESPONSE makes possible recording of one hour of 10KC FM data on one reel, or frequencies as high as 100 KC at 30 ips.

MAXIMUM PROTECTION of tape against breakage in transport.

HUMAN-ENGINEERED TRANSPORT virtually eliminates the chance of operator errors.

ALL SOLID STATE FM COMPONENTS for maximum reliability and durability of components.

INTERCHANGEABILITY of subcomponents such as oscillators and discriminators.

ECONOMY of operation and LONG EQUIPMENT LIFE.

Honeywell Tape Systems exploit the full range of FM capacity, which covers almost the entire field of instrumentation recording. Environmental testing, spectral analysis, process simulation, medical research, seismic studies, and wind tunnel analysis are but a few of the areas dominated by FM data handling methods. A pioneer in this field, Honeywell has established a reputation for high reliability and outstanding competence in the design and manufacture of FM tape systems.

Be certain to consider Honeywell Tape Systems in every proposal involving Data Acquisition.

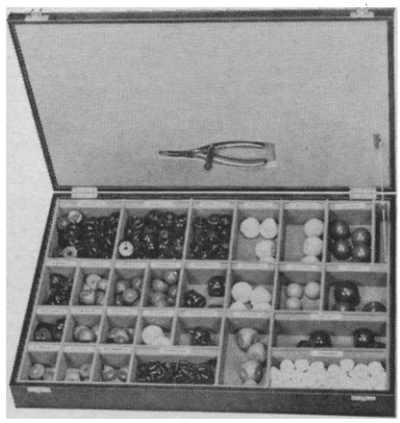
now at a new reduced price of $219.95

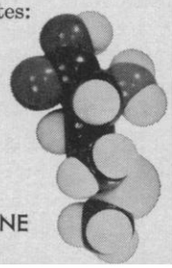


CONSTRUCT ACCURATE 3-DIMENSIONAL REPRESENTATIONS OF MOLECULAR STRUCTURES *with a* **CATALIN**

molecular model set

Catalin Models consist basically of distinctively colored spheres and comprise eleven elements in their various valency states:

HYDROGEN
CARBON
NITROGEN
PHOSPHORUS
OXYGEN
SILICON
SULPHUR
FLUORINE • CHLORINE
BROMINE • IODINE



All elements are designed to give appropriate representation to the three basic dimensions of the atom:

Bond Length • Bond Angle • Spherical Diameter

Each model set is supplied complete with rubber pegs for joining atoms to form molecules, pliers for extracting pegs, and an engineering drawing showing dimensions and facial angles of each atom, in lined and partitioned cabinet.

250 atomic models of 11 elements, complete with pegs, extraction pliers, in lined partitioned cabinet **$219.95**

Additional Atoms **.90** EACH

Kodak reports on:

a little sensitivity for science from business . . . picking the right stein for potent brews . . . reducing the fire hazard in biochem labs . . . utterly simple photomicrography

Autoradiography at various levels

Science is a way of life. Business is another way of life. The two depend on each other, and frequently they wear each other's clothes. They try to avoid grating on each other's nerves.

One of their innumerable areas of contact concerns photographic materials. Practical, immediately applicable knowledge of how to make all kinds of effective photographic products has grown up under the auspices of business. Science needs the products. Life science, for example, has turned to the photographic technique of autoradiography as one of the most fruitful and convenient for its high purposes. Molecular biologists have no time, background, desire, or need to prepare autoradiographic products. We, a business house, gladly do it for them. That we do it has become known largely through communications between scientists. We are prompted to do it by a certain feeling of obligation beyond ordinary business motivation. (There, that didn't grate too badly, did it?)

Currently we can make four levels of autoradiographic sensitivity. Type NTB3, the highest, records all charged particles moving through it because the curve of spatial rate of energy loss against energy for each kind of charged particle passes through a minimum, and NTB3 responds down to the lowest of the minima. Naturally, this maximizes trouble with background density. At the other end of the scale stands Type NTA, where exposure times may be of the order of months, to the astonishment of casual photographers accustomed to 1/50-second shutter settings.

Detailed inquiries for autoradiographic products are welcomed by Eastman Kodak Company, Special Sensitized Products Division, Rochester 4, N. Y.

Windows have to be more than transparent

Word comes that KODAK IRTRAN 2 optical material is doing just fine in the rocket-propellant industry. The propellant crowd needs something transparent out to 14μ to hold their brews for i-r studies. Hydrofluoric acid plays a considerable role in their brewing operations, and IRTRAN 2 cells stand up to it.

But don't expect an IRTRAN 2 window or cell to stand up to liquid Br_2. It will get chewed up. Nor does IRTRAN 2 make out very well with molten chlorides. But they don't bother IRTRAN 1 much.

KODAK IRTRAN 1 windows adequately resist a molten LiCl-KCl eutectic at 410 C, are much easier than MgO to repolish as necessary, can take a lot more shock than BaF_2, and don't bulge like AgCl.

In this infrared window stuff, enthusiasm is a poor substitute for facts—even inconvenient facts. If you consult Eastman Kodak Company, Special Products Division, Rochester 4, N. Y., we won't pretend to know everything. Nevertheless, we do know quite a bit and might join you in finding out more. Provided we can discern a little golden ray of sunshine down at the end of the road.

How to keep a double bond

We have a very useful oxidizing agent which acts with such a light touch that it converts hydroxyls on very fragile steroids into carbonyls without bothering any of the double bonds, thioether linkages, or acid-sensitive groups present on the molecule. The name is *Bis(pyridine)chromium(VI) Oxide.*

The man who makes it didn't have time to invent the reagent. (He has many other EASTMAN Organic Chemicals to make, and he also has to manage the Synthetic Chemicals Division softball and basketball teams.) But by making it for sale as EASTMAN 8560 ($4.75 for 25 grams), he reduces the fire hazard in biochemical laboratories.

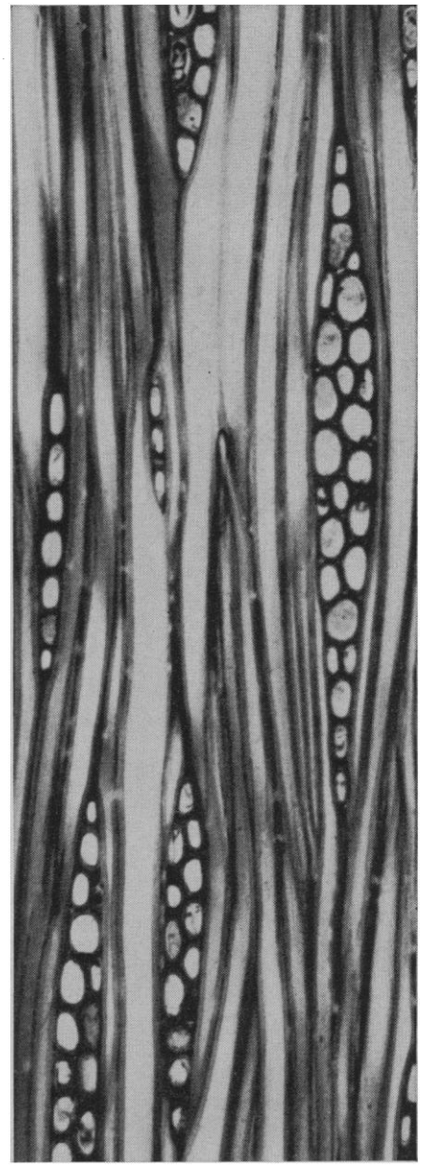
Without certain precautions during the mating of the wildly electron-avid chromium oxide to the eagerly electron-pushing trivalent nitrogen "a fire resulted with regularity," says the 1953 paper (*J.A.C.S., 75,* 422) that set off a long string of publications on this reagent by steroid chemists. These people shouldn't have to play with fire. They can feel safe with the reagent, if not with its preparation.

Despite the enthusiasm with which the union is consummated, it is not notably stable. If the bottle cap stays on tight, the complex will probably keep all right as the pyridine vapor drifts in and out of the chromium oxide. Since the function of the pyridine is to tie down the oxidizing potency of the CrO_3, the contents of this particular bottle may not weaken with age.

The material has recently been found to be a good room-temperature oxidizing agent even outside the steroid fraternity. It converts benzylic and allylic alcohols to their corresponding aldehydes, and simple aliphatic and aromatic secondary alcohols to ketones. Source: *J. Org. Chem. 26,* 4814.

Source for the reagent at the above price is Distillation Products Industries, Rochester 3, N. Y. (Division of Eastman Kodak Company).

What makes hickory the way it is



This photomicrograph shows the basic structure of hickory wood. It was taken on a plain, ordinary microscope with a BROWNIE Camera. For details on this use of BROWNIE Cameras, request a copy of "Photomicrography with Simple Cameras" from Eastman Kodak Company, Sales Service Division, Rochester 4, N. Y. Everybody knows what a BROWNIE Camera is.

Price subject to change without notice.

This is another advertisement where Eastman Kodak Company probes at random for mutual interests and occasionally a little revenue from those whose work has something to do with science

NEW

EKCO

FLUOROSCOPY GAUGE

Where the thickness of coating materials is so fine as to be beyond the minimum range of beta gauging, this new Ekco Fluoroscopy Gauge N683 provides accurate measurement of static samples. It employs a combined scaler and timer, and either a proportional counter or a scintillation counter. A small bremsstrahlung source such as Tritium or Promethium is mounted in the counter window and reflected radiation, which is proportional to the thickness of the coating, is counted; accuracies up to 1% can be achieved.

Full details and literature will gladly be supplied on request

Environmental rooms specially designed for insect studies have a temperature range from 60° to 90°F, with other ranges available. A thermistor sensor is used as the temperature sensing element and a transistorized temperature controller has control capabilities of ±0.5°F, or better. Two humidity systems, one at each end of the room, duct directly into the air flow and maintain relative humidity from ambient dew point to 90 percent relative humidity. The Modu-Lab insect room is constructed of one-piece molded sections with door in place and electrical assemblies prewired. Self-aligning joints permit fast assembly without need for special tools. Double walls of reinforced fiber glass have 2 inches of fully foamed polyurethane insulation. Interior has "extra" side walls of perforated aluminum panels—separated from the true walls to permit free horizontal air flow—and can be screened to handle insects in free flight. These metal panels can be quickly removed for disinfection of the room. Inside working dimensions measure 48 inches wide, with false walls, and 76 inches working height. Depth can be expanded by adding modular center sections. Standard rooms are 2, 4, 6, 8, and 10 feet deep, all with uniform width and height. Molded door has a safety latch on the inside and a Thermopane viewing window. Four-foot fluorescent lamps assure ample lighting. Interior is snow white, exterior is hard, lustrous Dura-Flex.—R.L.B. (Lab-Line/Hudson Bay Co., Dept. S444, 3070 W. Grand Ave., Chicago 22, Ill.)

Infrared spectrophotometer (model 421) a high-resolution, double-grating instrument covers the spectral range from 4000 to 550 wave-numbers (from 2 to more than 18 μ. The high resolution designed into the instrument permits more accurate identification of significant absorption bands which differ only slightly in frequency. The in-

The material in this section is prepared by the following contributing writers:

Robert L. Bowman (R.L.B.), Laboratory of Technical Development, National Heart Institute, Bethesda 14, Md. (medical electronics and biomedical laboratory equipment).

Joshua Stern (J.S.), Basic Instrumentation Section, National Bureau of Standards, Washington 25, D.C. (physics, computing, electronics, and nuclear equipment).

AAAS Symposium Volume No. 52

EVOLUTION OF NERVOUS CONTROL FROM PRIMITIVE ORGANISMS TO MAN

Editor: Allan D. Bass

1959, 240 pp. $5.75, AAAS members' prepaid orders $5.00

From a review in the Psychiatric Quarterly, January 1960:

This book is another in the superb series of monographs put out by the American Association for the Advancement of Science. . . . The text is actually a very readable review of some of the major research going on in various phases of neuropsychiatry.

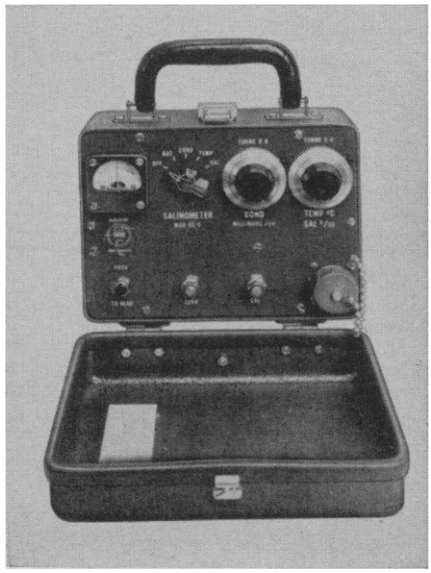
This book offers much more concrete and useful data than do a number of larger tomes dealing with the interdisciplinary approach to mental disease. It may be profitably read by anyone interested in the differing aspects of, or approaches to, the study of the nervous system and its activity.

British Agents: Bailey Bros. & Swinfen, Ltd. Hyde House, W. Central St. London, W.C.1

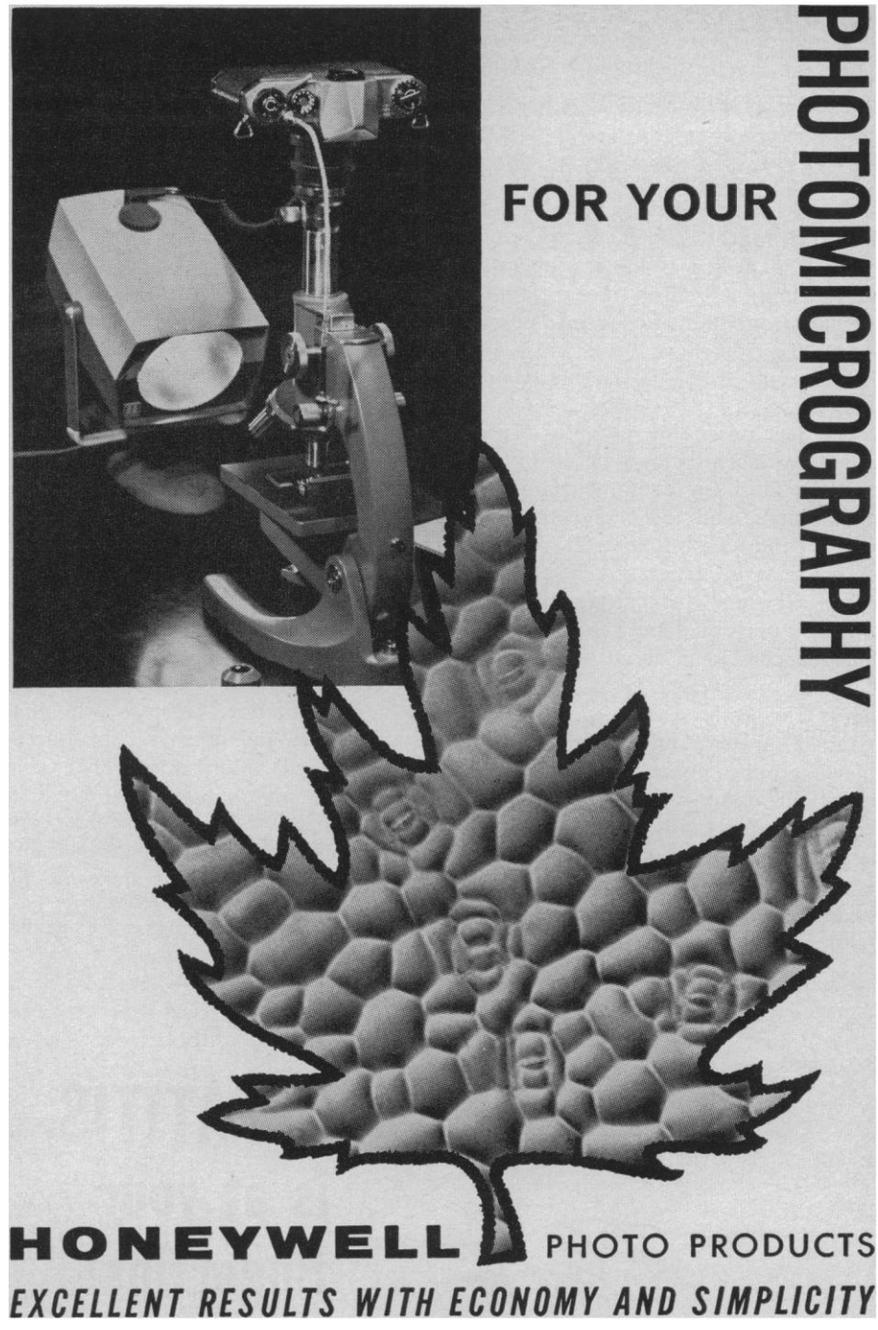
AAAS
1515 Massachusetts Avenue, NW
Washington 5, D.C.

strument employs two gratings in the first order which provide continuity of scanning with no sacrifice of dispersion or efficiency. In addition, a newly developed auxiliary grating interchange extends spectral coverage into longer wavelengths. It covers the range from 2000 to 250 wave-numbers, or 5 to 40 μ. The instrument also features continuous spectral presentation, fast scanning capability, automatic gain control, and automatic abscissa scale changes. This instrument is particularly suited for application in such fields as biochemistry, petroleum and petrochemical, agricultural chemistry, air pollution, cosmetics and essential oils. A brochure describing this instrument, its performance, applications, and specifications is available from the manufacturer.—R.L.B. (Perkin-Elmer Corp., Dept. S442, Norwalk, Conn.)

The model RS-5 **oceanographic induction salinometer** measures salinity, temperature and conductivity to depths of 300 feet. The conductivity cell consists of two toroidally wound coils arranged around a thick-walled epoxy tube. The first coil, driven by an oscillator, induces current that flows in a closed loop through the cell bore and in the surrounding water. The second coil is used to measure the magnitude of the induced current. Because the bore offers much greater resistance to



the current than does the surrounding water, the cell may be operated as close as 6 inches to obstructing surfaces. Less than 1 minute is said to be required by the measurement.—J.S. (Industrial Instruments, Inc., Dept. S433, 89 Commerce Rd., Cedar Grove, N.J.)



The classic maple shape outlines a specimen micrograph of leaf epidermis made at X100 with a Honeywell Pentax camera and a Honeywell 52-A Strobonar for flash illumination. (Sharp eyes will identify the leaf as *philodendron*, not maple; please indulge our preference in design!)

A Pentax should be a part of your standard laboratory equipment. At $149.50 for the Model H-1, the reliable Pentax is undoubtedly your very best choice of a versatile single lens reflex camera. There are 13 interchangeable lenses for it (35 mm to 1000 mm).

The 52-A Electronic Flash Unit ($69.95) plugs into 110V-AC and features a modeling light which insures your directing the flash into your microscope's mirror. This flash unit absolutely stops specimen movement and the effects of camera shake; it cannot burn or cook slides.

See these fine products at your local Honeywell Photo Products dealer's, or write for brochure to David Moore (209) Honeywell-Heiland, Denver 10, Colorado.

Honeywell

Photo Products

Low temperature radiometer is designed for remote measurement of the temperature of cool objects. The radiometer is available in models with field of view from 1 milliradian to 10 deg and can measure temperature from −80° to +30°C. Accuracy is said to be ±1°C for objects of known emissivity. The device is battery operated and includes a built-in recharger that operates from standard a-c line power. —J.S. (Te Company, Dept. S435, 415 E. Montecito St., Santa Barbara, Calif.)

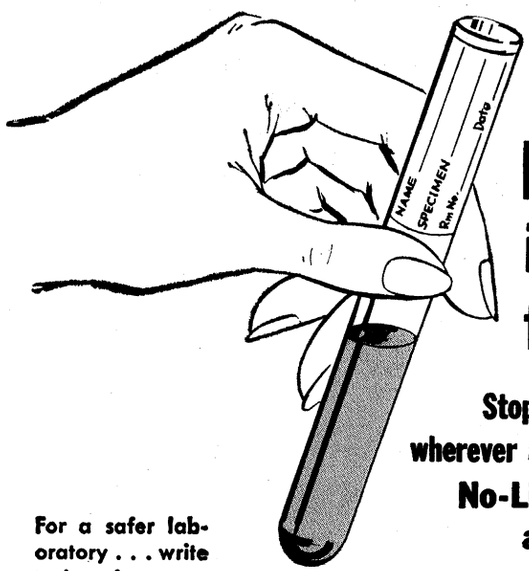
The Sage micro-flow pump is a lightweight, portable, battery-operated pump which is ideal for continuous infusion into animals, and for many other laboratory and clinical uses. It operates by electrolysis, generating a gas that moves a piston which drives fluid at a generally uniform rate. The unit is less than 3 inches long, about ⅝ inches in diameter, and weighs 28 g; capacity is 1 ml. Flow rates can be varied from 1 ml/½ hr to 1 ml/20 hr, with the rate determined by the resistor capsule used. The pump comes complete and ready for use with 1-ml/hr resistor capsule, battery pack and supply of electrolyte. Also available is a resistor capsule set which includes four capsules which permit running the pump at rates of 1 ml/½ hr; 1 ml/2 hr; 1 ml/8 hr; and 1 ml/20 hr. Extra battery packs and electrolyte are available, and the pump can be re-used repeatedly.—R.L.B. (Sage Instruments, Inc., Dept. S438, 2 Spring St., White Plains, N.Y.)

Effects of High Pressures on Materials is the title of a 28-page booklet including bibliographic and data sheets. The bibliography includes 100 annotated references and the data sheets contain 16 graphs, charts, and tables that describe the effects of high pressures on various basic material parameters such as melting temperature, self-diffusion coefficients, hardness, and thermal emf.—J.S. (Ilikon Corp., Dept. S463, Natick Industrial Center, Natick, Mass.)

Valve for gas chromatographs permits gas sampling, column switching, backflushing, and other valving operations at high temperature. The valve operates by approximating the ports in a flat lapped stainless-steel disk containing calibrated sample loops or transfer passages with mating holes in the body of the valve. Leak-free operation is claimed by reason of the perfection of the surfaces sealed and lubricated with silicone grease. Direct opposition of the ports in the two plates eliminates spaces not thoroughly purged and minimizes exposure of the gas stream to lubricated surfaces. Silver-soldered stainless-steel construction makes temperature limit a function of the silicone lubricant and seal.—R.L.B. (Wahl-Henius Institute, Inc., Dept. S436, 4206 N. Broadway, Chicago 13, Ill.)

Why extend optical range? bulletin explains the significance of mechanical weight calibration errors. Many weight determinations measure the difference of a substance before and after it has undergone some change. Weighings of this nature are referred to as differential weighings. On modern balances, the last two to four decimal places of the result are determined by reading an optically projected scale measurement of beam deflection from the zero position, while the other digits are determined by the use of mechanical weights. The accuracy of that part of the result given by the mechanical weights is determined by the precision with which the balance will repeat its readings, plus the calibration errors of the mechanical weights. This technical bulletin shows how significant these errors can be, and concludes that differential weighings should avoid the use of mechanical weights. For maximum accuracy, the analyst should make differential weighings on a balance with a wide optical range. Bulletin TIB 10005. —R.L.B. (Mettler Instrument Corp., Dept. S443, 20 Nassau St., Princeton, N.J.)

Plastic balance dishes are molded from pliable Polyethelene and have a capacity of 15 ml. They are designed to eliminate the cleaning time and breakage of expensive glass dishes. When contaminated, they can be thrown away. They are lightweight, and tab handles are provided for convenience in handling. They are especially adaptable in use for spot testing and can be flexed to facilitate transfer of samples directly to narrow mouth flasks, thus saving considerable valuable time. Catalog No. DBP-65; outside diameter, 65 mm; depth, 12 mm; capacity, 15 ml. Shipped in mailing tube of 100 (minimum order). Price, $5 per 100.—R.L.B. (Peel-A-Way Scientific, Laboratory Products, Dept. S439, P.O. Box 4265, Long Beach 4, Calif.)



HEPATITIS is at your fingertips!

Stop cross-infection... wherever a label is required, use No-Lick TIME TAPES and LABELS

- **Keep your hands away from your mouth**
- **Keep your hands away from contact**

Keep contact of bacteria to a minimum with Self-Sticking TIME Tapes and Labels.

Satin finish, vinyl coated Time Tapes and Labels come in a large variety for every laboratory need. Or they can be imprinted to your specifications. White or in colors, they accept any pencil or pen markings.

For a safer laboratory . . . write today for complete information and samples.

A Clean Shot

This small Millipore filter holder attaches to a standard Luer-Lok hypodermic syringe and is ideal for dispensing dust-free lubricants to miniature bearings and other precise mechanisms; for sterilizing small volumes of biological materials (it may be autoclaved with MF® in place); and, when used with a pipetting valve, for filling small vials. Uses 13 mm dia. Millipore filters. Order from or write to Millipore Filter Corp., Bedford, Mass.

Millipore®

PHOTOVOLT
Electronic pH METERS

A complete line of pH meters, incorporating permanently frictionless taut-suspension indicating meters, modern electronic tubes and circuits. Simple in operation and maintenance; featuring sealed amplifier plug-in units.

Two-way pH Meter Model 85

- Single range 0-14, scale length 3", readable to 0.05 pH Unit.
- Available — compact battery pack for field use ($38.00 addtl.).
- Fully stabilized, simple, usable with all types of electrodes.

Write for Bulletin #195

$135

High Precision pH Meter Model 110

- Single range 0-14, scale length 7", readable to 0.02 pH unit.
- Temperature control 0-100° C., voltage selector for 80-260 volts.
- Available — carrying cover and baseboard for bottles, beakers.

Write for Bulletin #105

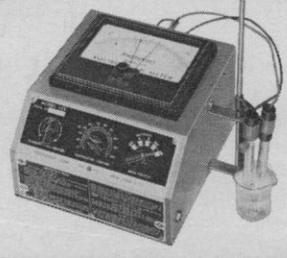
$265

Standard Laboratory pH Meter Model 115

- Single range 0-14, scale length 4", readable to 0.05 pH unit.
- Temperature control 20-100° C., available with carrying case.
- Additional millivolt scale for redox measurements and titrations.

Write for Bulletin #225

$175



Portable pH Meter Model 125

- Single range 0-14, scale length 5½", readable to 0.03 pH unit.
- Only 3 batteries, standard radio type, 2,000 hours of service.
- Available — carrying frame for instrument, beakers, bottles.

Write for Bulletin #118

$225

Tester Model 25 for Checking and Adjusting pH Meters
A compact, inexpensive instrument without batteries; for checking performance of PHOTOVOLT and other pH meters. Requires neither electrodes nor buffers. Write for Bulletin #138 **$78**

tained also that the social sciences by their very nature are bound to be a mixture of humanistic studies, derived from the knowledge which man has of himself through being a man, and "scientific" studies, derived from careful observation, sampling of the social universe, measurement, indexing, and testable theories. I do not think, for instance, that all of economics is contained in econometrics, but I think we owe a great deal to those who pioneered in the measurement of economic variables, and our capacity to control depressions, for instance, has been substantially increased by our ability to measure at least the gross variables of the economic system. Nor do I think that political science is encompassed in the nascent discipline of politicometrics. Historically, however, the weight in political science has been wholly on the humanistic side of the study, and important contributions are still to be made on the other side. I believe this to be especially true in the conduct of international systems where the absence of accurate and well-sampled quantitative information is a serious handicap.

I agree entirely with Gomberg that there is room for both traditions. Where, however, as in the case of political science, the introspective and philosophical tradition has been pursued almost to the exclusion of the other, it is surely legitimate to call attention to this imbalance.

Feedback and Nonfeedback

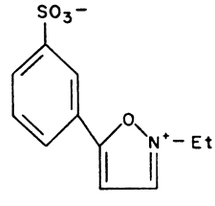
This is a comment on a comment [Moment, *Science* **136**, 1056 (1962)] on a comment [Li, *ibid.* **136**, 1055 (1962)] on a comment [Moment, *ibid.* **136**, 262 (1962)]. Moment considers that the "nonfeedback model" suggested by Li to account for the high degrees of polymorphism in species such as the brittle-star *Ophiolis aculeata* "assumes a *stable* diversity already in existence which does not change, while the proposed theory of protective variation assumes that any mutation producing a new pattern would enter the system with a selective advantage *which would decline as the frequency of the responsible gene increased*" (italics mine). On this basis, he visualizes the testability of the merits of the reflexive selection (feedback) model and the balancing selection (nonfeedback) model.

The two models may indeed yield testably different predictions, but in neither case is the selective value of a newly introduced allele unchanged as the allele increases in frequency.

In a randomly crossbreeding species, with heterozygote superiority at a locus (one form of "balancing selection"), a heterotic allele newly introduced, whether by mutation or immigration, will be present first in heterozygous condition and will remain so until its frequency, relative to population size, is high enough to create an appreciable probability that heterozygote-carriers will mate. From then on, its selective value will decrease from its initial maximum to the value determined by the equilibrium ratio of homozygotes to heterozygotes for the introduced allele, which value in turn will depend on the

A new Peptide-former

N-ETHYL-5-PHENYLISOXAZOLIUM-3′-SULFONATE (Woodward's Reagent K)



Woodward's Reagent K, manufactured by PILOT, functions as a peptide bond former by combining with the acid group of one amino acid or peptide to form an active ester. This ester bond is then broken by the amino group of a second amino acid or peptide ester with concurrent formation of a peptide and a water-soluble by-product.
The new procedure is simple and fast, gives exceptionally high yields of very pure peptides free from by-products and without appreciable racemization.
Also available from PILOT are synthetic polypeptides. For more information, write to

Compact, Lightweight WARBURG APPARATUS

Designed for today's modern lab, the dependable Bronwill Warburg features a unique electrode heating system . . . there's no lag or overshooting of temperature, *and* operating temperature is reached in 20-30 minutes. You'll make new temperature settings faster, too, (from 0 to 50°C) with magnetic thermoregulator.

The new Warburg is rotatable through 320°—lets you bring any of 14 double capillary manometers in front for easy reading. Has transparent Plexiglas bath chamber. Compact—only 20½" in diameter; its circular shape conserves vital space on lab bench.

A specially designed unit with 14 built-in spotlights is available for photosynthesis.

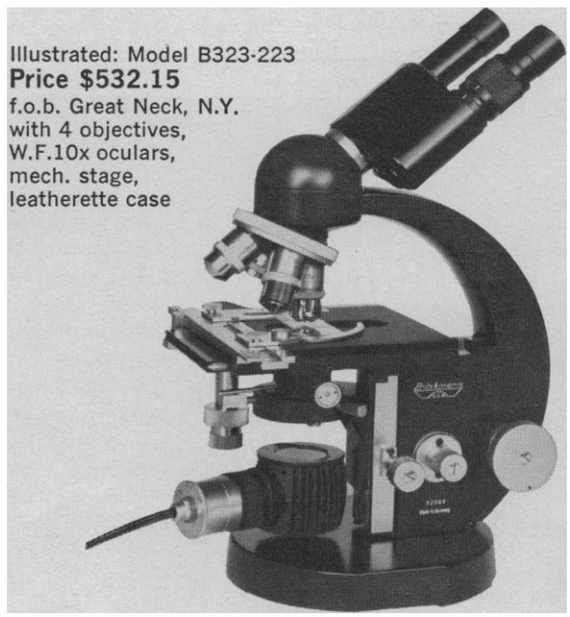
BRINKMANN MICROSCOPES

(Made in W. Germany)



Illustrated: Model B323-223
Price $532.15
f.o.b. Great Neck, N.Y.
with 4 objectives,
W.F.10x oculars,
mech. stage,
leatherette case

To the selection of outstanding scientific instruments available under the BRINKMANN label has been added a line of Student and Laboratory microscopes incorporating many features usually found only in higher priced equipment.

- **Interchangeable, rotating BODY TUBES, Monocular-Binocular-Trinocular**
- **Large built-in mechanical stage with LOW co-axial knobs**
- **Separate fine adjustments with Ball Bearings**
- **Built-in illumination with Field Diaphragm (Koehler)**
- **Centering condensers with Swing-out front lens**
- **High power objectives with retracting mount**
- **Wide field PLANO eyepieces**

selective value of the homozygote. In the simplest form of heterozygote superiority, let us consider a locus with multiple alleles with heterozygotes of equal selective value, arbitrarily set at 1, and homozygotes assigned selective values of less than 1 by an amount s_i, which may be different for each allele. The equilibrium frequency $\hat{p}_i$ of any one allele A_i is given by the formula presented by Li, initially derived by Wright [in *Genetics, Paleontology and Evolution*, Jepsen, Mayr, Simpson, Eds. (1949), pp. 365–386]:

$$\hat{p}_i = 1/[s_i \cdot \Sigma(1/s_i)]$$

and the proportion of zygotes homozygous for an allele to those heterozygous for it is

$$\hat{p}_i^2/2\hat{p}_i(1 - \hat{p}_i) = 1/2[s_i \cdot \Sigma(1/s_i) - 1]$$

a value which decreases with increase in the number of alleles and in the selective disadvantage of the homozygote. Until the new allele reaches its own equilibrium frequency, it will be selectively favored, vis à vis earlier alleles already present in equilibrium proportions in both homozygous and heterozygous conditions.

Furthermore, the whole population's net fitness ($\bar{W}$) will be increased by the acquisition of a new heterotic allele at the locus. The early improvement in fitness will be less than the ultimate equilibrium level, due to the temporary excess of homozygotes, for the preexisting alleles. The equilibrium fitness of the population is given by

$$\bar{W} = 1 - \Sigma s_i \cdot \hat{p}_i^2 = 1 - 1/\Sigma(1/s_i)$$

where the value of each $\hat{p}_i$ is substituted according to the earlier formula. Regardless of the value of s of the newly introduced allele, adding its reciprocal to the preexisting $\Sigma(1/s_i)$ will increase the value of the sum, decreasing the value of the fraction which is to be subtracted from 1; in other words, acquisition of a new allele at a heterotic locus makes the fitness of a population approximate more closely that of an ideal population composed solely of heterozygotes.

This increase in population fitness is similar to that arising from the addition of an allele to a system in which rarity is favored. Again employing the simplest example of this type from Li, let us consider a locus with n alleles each with frequency p_i and genotye selective values $1 - c \cdot f$, where f is the zygotic frequency of the genotype (p_i^2 for A_iA_i, and so on). At equilibrium, $p_1 = p_2 = \ldots = p_n = 1/n$. The fitness of the population attributable to this locus will be

$$\bar{W} = 1 - 5\,c/n^3$$

This again will increase as n increases.

Thus, the particular possibility for testing envisioned by Moment does not exist, both selective mechanisms (i) giving persistent genotypic diversity, (ii) serving to improve population fitness as the number of alleles increases, and, more importantly, (iii) giving the maximum selective advantage to the newly introduced, hence rare, allele. Only careful measurement of the change in proportions of (known) homozygotes to (known) heterozygotes in successive generations of populations initiated with arbitrary proportions will permit discrimination of the two models in any situation.

This is not intended to derogate the possibly, even probably, significant role of the selective value, to individuals and to populations, of visible diversity as such.

CONTROLS and RECORDS pH AUTOMATICALLY

The New Brunswick Automatic pH Controller provides *continuous* regulation, monitoring and recording of pH in any active fermentation or chemical process at laboratory, pilot plant or production levels.

This compact unit controls pH at any pre-selected level throughout the entire acid-base range with an accuracy of ± 0.1 pH. Specially constructed electrodes with insulated wire leads withstand *repeated* steam sterilization at temperatures up to 250°F and pressures to 100 psi.

The mobile apparatus, with electrodes, is readily integrated in New Brunswick Fermentors as well as most other fermentation vessels. Find out how this apparatus can solve your individual pH control problems. Unconditional One Year Warranty.
